IS THIS LEVEL OF RELIABILITY REALLY NECESSARY?

ACCUTRACK

If you've ever lost data due to a faulty disk, you know how important reliability can be.

That's why Accutrack disks are critically certified at 2-3 times the error threshold of your system. Why they're precision fabricated for higher signal quality, longer life and less head wear. And why we take such extra steps as testing single-density mini disks at double-density levels. So you don't have to worry about the reliability of your media.

Accutrack disks. OEMs have specified them for years. You can trust them for your data.

Who needs a top 10?

LISTS OF the top 10 records, cars, books and television programmes exercise a curious fascination. It is hardly surprising that a number of micro magazines publish top 10s or 20s of computers or programs.

At best a top 10 can provide three things: first, entertainment; second, an indication of which companies and/or products are selling; third, help in deciding which products might be worth looking at in more detail.

In the first case, it does not matter much if the list is accurate or not. Who cares if the 10 most beautiful words or top 10 tie-wearers really are or are not the top 10?

In the second case, however, accuracy is essential. A top 10 sales chart is worth only as much as the data on which it is based. Even then, a guide to sales is not necessarily a guide to success. For example, Texas Instruments has just dropped out of the home-micro market when, according to Dataquest, it was number 2 in the world after Commodore in the category of micros under $1,000. The company's recent huge quarterly losses show that even these sales were unprofitable.

In the third case, the value of even an accurate list is very much a matter of taste. There is not necessarily a connection between any of the items listed. All that *Coronation Street* and *This is Your Life* have in common, essentially, is that they are popular.

Neither is popularity a guarantee of quality. The *Sun* newspaper sells twice as many copies as *The Times, Guardian, Daily Telegraph* and *Financial Times* put together. This does not make it a more comprehensively reliable guide to world affairs. It is certainly a more accurate indicator of popular taste and is also cheaper, which counts for a lot in the U.K.

Yet in the microcomputer business there is nothing quite as strong as the bandwagon effect. The whole industry is crying out for standards, and quality may take second place to the widespread use which establishes a *de facto* standard.

Few people would claim that CP/M is the best possible micro operating system, or that in hardware terms either the Sinclair Spectrum or IBM PC represent the optimum hardware for games playing or business use. These products do not sell only insofar as they are good or bad: they sell because they sell.

Another factor is that, by and large, most of the people currently buying micros and software do not have the slightest idea what they are doing. It is easy to buy, say, a Commodore 64 without knowing it needs a considerable amount of programming just to draw a straight line. It is easy to order an Electron without considering how joysticks, discs and printers can be plugged into it. That is not to say that these are rotten machines, but it is the case that most of the people who buy them are, in computer terms, innocents. The problem is that a list of best-sellers can be used to avoid thinking about what is being purchased. "Thousands of other people have bought it so it must be good" — if only that were true.

So top 10 lists are important in computing, and we only wish there was one we felt we could rely on. Unfortunately a reliable guide is only likely to come from the independent analysis of confidential sales figures. In the current market, where whopping lies are far from unknown, which companies would be willing to release them, and to whom?

The Computer Retailers Association, as desperate for information as the rest of us, is trying to answer this very question. It is possible the CRA will produce a guide, at least to the best-selling business software.

It would be a start. We live in hope.

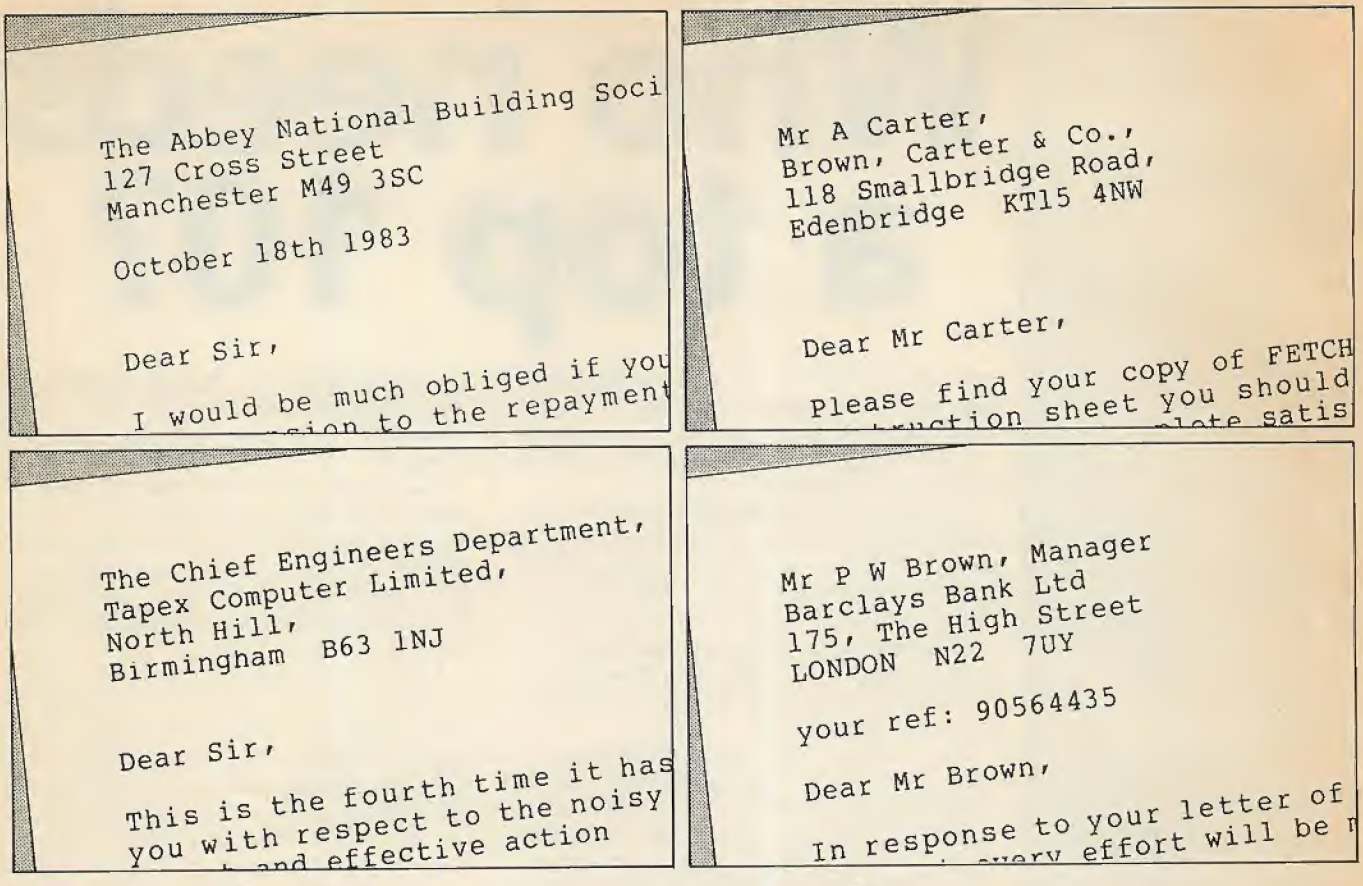
5 Years ago...

Commodore has reduced the price of its Kim 1 to £99.95. This price puts it well in the range of students, hobbyists and schools, but it remains ideal for control applications and training industry.

Commodore stresses that the Kim 1 is not a kit, but a complete microcomputer with a fully assembled PC board, needing only a power supply to operate. Based on the MOS 6502 microprocessor, it has 2K bytes of ROM, 1K byte of RAM, a keyboard and six-digit LED display. The system can be expanded significantly, starting with the Kim 3 8K RAM memory boards (£193.32 inc VAT). This can be wired in by the user — all the required connectors are built-in — or attached more neatly by using a Kim 4 motherboard (£96.12 inc VAT).

An ordinary audio cassette unit can be attached to provide auxiliary storage. All interface circuits provided on the Kim 1 board including a Teletype interface are ready for connection. If the Teletype has the facility, Kim can also handle paper-tape input and output.

Practical Computing, Volume 2 Issue 2



For £46, your word processor can get personal.

The trouble with most CP/M* word processors is that they can't work out who's who.

While they're fine at sending one letter to large lists of people, they're virtually useless for one-off communications.

In fact, getting one name from your name and address file is such hard work that your secretary probably retypes it every time it is needed, wasting time, money and an expensive name and address file that is only used for mailing shots.

Business Data Capture, however, have now developed a new program which personalizes CP/M* word processing.

It's called FETCH. And that's exactly what it does.

When you call up a key name or number, it dives into your name and address file and transfers the name and address that you need to the document you're processing.

It can be formal or familiar, according to the relationship you have with each individual.

It also adds the day's date automatically. And a reference if necessary.

There's no limit to the number of names and addresses that FETCH can handle, even if they are in Datastar format.

So besides saving a great deal of time, it cuts out all possibility of error and embarrassment with your clients.

Yet, the cost is only £46, including VAT, post and packing. Just send the coupon with your cheque or credit card number to: Business Data Capture Ltd., 262 Regents Park Road, London N3 3HN.

Or if you would like to order by telephone with your credit card, ring 01-349 4095.

You'll receive your program disc with a clear instruction manual within 14 days.

And if you are not satisfied for any reason, you are free to return them to us within 7 days for a full refund.

BDC FETCH™
The program that names names.

To Business Data Capture Ltd., 262 Regents Park Road, London N3 3HN. PC2.
Please send me your FETCH program disc and instruction manual.
I enclose a cheque for £46 including VAT, post and packing, payable to Business Data Capture.
I would like to pay by credit card. My number is _____ (Visa/Access only)
My computer is: _____ My disc size is: 5 inch/8 inch (please circle)

War games

IN THE December issue of *Practical Computing* you reviewed several games, among them Eastern Front. You praise it as a good game with amazing graphics.

Is that all you have to say about it? After all, the object of the game is to plan the death of men most effectively. The player is encouraged to do better than Hitler while sitting in the armchair.

Children might believe that this is what war is like. Adults should know that war is no fun and Hitler is not JR.

Oliver Völckers,
Osnabrück,
West Germany.

● The Editor replies: Does the fact that Eastern Front offers a fairly accurate historical simulation of the Barbarossa campaign make it less acceptable than other war games such as chess, or make it more educational? What do other readers think?

HP Model 16

MANY THANKS for the copy of December's *Practical Computing*, and your review of the HP series 200 Model 16. I thought I had best let you know of a few inaccuracies which have crept in, just to keep the record straight.

HPL is not a version of APL, nor indeed does it resemble it. The nearest one can say is that it looks rather like a cross between Basic and Algol 60.

The Model 16, unlike some other members of the HP Series 200, cannot run Unix. Finally, the Basic manuals described are included in the cost of the system.

All of these are relatively minor matters and in no way spoilt my appreciation of your very good review.

Ron F Weeden,
Hewlett-Packard Ltd,
Wokingham,
Berkshire.

Bad service

I HAVE BEEN trying to use a 48K Spectrum to help in the day-to-day running of my dental practice for the last 12 to 14 months or so. I have written my own software, which I also sell to my professional colleagues in a small way. The system is now proving to be a great help.

However, one thing that has certainly not helped is the unhelpful and ill-mannered attitude of the majority of firms in the British computer hardware / peripheral industry. I no longer expect to receive replies to eight out of 10 letters of enquiry that I write, even though I always send an SAE.

When I eventually do find a firm that will condescend to soil its hands with the sordid business of actually selling me something, I no longer expect the things to function as advertised, if at all.

One of the latest offenders has been Kempston Electronics — a Centronics interface that had the driving software recorded on the leader tape of the cassette, and an interface unit that locked up the computer completely. These were eventually replaced, but two enquiries that I have made to the firm since then have had no reply. One of them was to ask why I cannot use the complete character set supplied with my printer, a Star DF-510, or even the complete character set of my Spectrum. The printer is recommended in Kempston's advertising as being completely compatible.

The other firm that I have had recent contact with is the Spectrum group. I phoned a number of the group's local dealers to enquire about the Viscount disc drives for the Spectrum and was greeted with ignorance, apathy and downright rudeness. One salesman was helpful — I expect he's been sacked by now.

I daresay we shall all soon be treated to the sight of the British computer retail and manufacturing trade wringing its collective hands, and bemoaning the fact that they are going out of business, while the Japanese — or whoever happens to be the latest scapegoat — are flourishing. Will I feel sorry for them? I'll leave you to guess the answer to that one.

I realise that my experiences are far from unusual — indeed, a lot of people will probably feel that I've got off very lightly so far. However, I don't see why we should have to put up with this situation. The money comes from our pockets, after all, and if the bad firms are constantly exposed, then maybe other customers will go elsewhere, until only the decent firms are left. My local Micromanagement dealer was most helpful recently when I was looking for a new printer — needless to say, he got my order.

W H Roberts,
Pencoed,
Mid Glamorgan.

IBM PC XT

PERHAPS you would care to note the following points relating to your review in the October issue of *Practical Computing*.

The use of the word Multiplan is invalid since it is more than eight letters long, so it is thus shortened by DOS to Multipla.

When creating a path, there should not be any spaces after the \ symbol. The current path can be checked simply by typing Path, when at command level. This would have shown up these points. The Path command is only for use in batch or command situations, and is not a default route to a data file if not in the current directory.

When searching for a file not in the current directory, DOS expects the drive letter as part of the file identifier; otherwise it only searches the logged drive. Furthermore, directory searches are carried out on each drive only by the previously set CHDIR pathways for the individual drive, and files that are actually in the volume may be invisible.

By keeping important files, such as utilities, in a specific directory and setting the appropriate path, it may be possible to use them from any current drive or directory position.

To a newcomer, the DOS 2.0 manual is without doubt an intellectual challenge second to none. It makes learning the Highway Code an exercise to be enjoyed in comparison.

Martin Guyer,
London SW6.

What about Tandy?

IN OUR FAMILY we have several systems which we use for the normal home-computing activities, and we often get asked for advice on purchasing computers. Therefore we were interested in Jack Schofield's article "Home Truths" and recognise the validity of his general principles.

Many journalists, including some in *PC*, mention way-out ideas such as the Spectrum and Microdrives for business use. A basic knowledge of business costs would show that a cheap unit and expensive labour are not cost effective. Any competent typist will double their output on a good keyboard, and the error-count on a poor machine will prohibit its use for business.

Where we would disagree with Jack Schofield is that the TRS-80 is, by implication, considered poor. It is a reliable machine that has suffered no significant compatibility problems for years and has a mass of good software at all prices. We consider that LDOS and Newdos 80 are superior to the DOSs available for the Apple and certainly the Commodore 64.

The ROM-based word processor of the BBC is simple to use but lacks the power of Scripsit, let alone Superscripsit; and Enhanced VisiCalc for the TRS-80 seems to have more commands than the Apple

(continued on next page)

Our Feedback columns offer readers the opportunity of bringing their computing experience and problems to the attention of others, as well as to seek our advice or to make suggestions, which we are always happy to receive. Make sure you use Feedback — it is your chance to keep in touch.

(continued from previous page)
version. We have never bothered to add the high-resolution peripherals as colour and high resolution gobble up memory.

When our TRS-80 was destroyed by fire we had the opportunity to purchase some new equipment at the insurance company's expense. Sharing Jack Schofield's view that in a few years there will be much better machines, we chose to buy a Model 1 TRS-80 which was available from our local Tandy store, but added a non-Tandy 64K memory which brought the total cost to just over £200. A further £230 added a single disc drive.

During the period when we were without a computer, we were able to walk into any Tandy store and the management were pleased to let us use the demo machine. Despite the fact that Tandy is now using the Model 4, all our Model 1 software can be made to run under LDOS without problems. This, combined with the fact that Tandy actually makes a profit on computer sales and is therefore likely to stay in business, must make them at least a reasonable buy.

W Trayler,
Hornchurch,
Essex.

Calling by name

I WAS very interested to read John Hooper's article in the November *Practical Computing*. Calling subroutines by name certainly aids readability of Basic programs but, as I am sure many readers will have realised, in many dialects of Basic there are better ways of achieiving it.

If the line number in Goto can be an expression, as on the Atari, Spectrum or Oric, then Hooper's switching routine can be eliminated completely. Instead the subroutine names are simply the names of variables, initialised to the appropriate line numbers. For instance, in his example he enters subroutine Answer via

```
5040 SUB$ = "ANSWER":
  GOSUB 100
```

in the main program, and

```
120 IF SUB$ = "ANSWER"
  THEN 1200
```

in his switching routine. We can streamline these by

```
5040 GOSUB ANSWER
```

plus an earlier initialisation statement

```
ANSWER = 1200
```

The result is clearer to read and more efficient.

If this is not permitted, many dialects — Commodore is one — allow the switching to be improved by means of On Goto, which is much more efficient than a string of If statements. The switching routine is now a single statement:

```
100 ON SUB GOTO 100,
  1200. . .
```

the jumps to the switching routine look like

```
5040 SUB = ANSWER: GOSUB
  100
```

and we still need an earlier initialisation like

```
ANSWER = 2
```

Admittedly, in neither of these methods can we pass arguments by concatenating on to the subroutine name, but surely it is anyway clearer and more efficient to use a separate argument variable? Referring again to John Hooper's example, the line:

```
1260 SUB$ = "DELAY01" :
  GOSUB 100
```

with the associated decoding exercises

```
130 IF LEFT$ (SUB$,5) =
  "DELAY" THEN 1300
1310 DEL$ = RIGHT$ (SUB$,2):
  DEL = VAL (DEL$)
```

would be replaced by

```
1260 ARG = 1: GOSUB DELAY
```

in the first method; or, in the second method, by

```
1260 SUB = DELAY: ARG = 1:
  GOSUB 100
```

and no decoding is required. Furthermore, explicit argument passing is much better when the argument is not a constant, as is nearly always the case. Compare:

```
1260 SUB$ = "DELAY" +
  STR$(X + Y): GOSUB 100
1310 DEL$ = RIGHT$(SUB$,
  LEN(SUB$) – 5):
  DEL = VAL(DEL$)
```

with

```
1260 ARG = X + Y: GOSUB
  DELAY
```

or

```
1260 SUB = DELAY: ARG =
  X + Y: GOSUB 100
```

Tony O'Hagan,
Department of Statistics,
University of Warwick.

Commodore 64 bugs?

I HAVE JUST COMPLETED a writing *Study Guide to the Commodore 64* for Pitman Books and have discovered various bugs in the Commodore 64 and Vic-20 Basic ROM.

Commodore 64 owners should try

```
10 T = 1
20 T = T/2 PRINT T : GOTO 20
```

to produce a long sequence of numbers, becoming smaller. After a time the numbers go to zero:

```
5.87747176E – 39
2.93873588E – 39
0
```

which is what should occur. Altering the value of T in line 10 to –1 while keeping line 20 exactly the same, produces a sequence which ends

```
– 1.17549435E – 38
– 5.87747176E – 39
2.93873588E – 39
0
```

which is in no way correct. There should not be a change from a minus to a plus.

Now try

```
T = 4.25352959E + 37 : PRINT
*2
```

to which the response is

```
?OVERFLOW ERROR
```

Entering Print T + T produces the value 8.50705917E + 37.

For further interesting results try

```
V = 1.70141183E + 38 : PRINT V
V = (V/2)*2 : PRINT V
```

to gauge the amusing possibilities open to the adventurous user.

Boris Allan,
Stockport,
Cheshire.

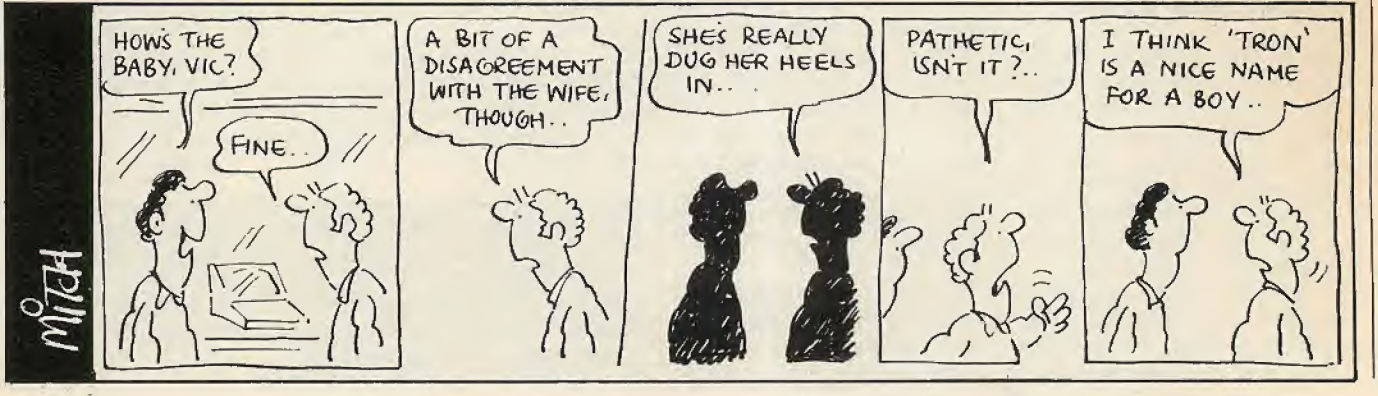
Not Julian, but Gregorian

I AM SURPRISED and alarmed to learn from your November 1983 issue, pages 161 and 178, that the present calendar is Julian. During my lifetime so far all calendars and diaries for use in this country have used the Gregorian, not the old-style calendar which was abolished in Britain and Sweden in September 1752.

Perhaps this explains why I am always about a fortnight behind in my work, but more likely someone has confused the Julian calendar with the Julian day used by astronomers. This day runs from noon to noon, not midnight to midnight, and starts on noon Monday –4712, ending noon, Sunday December 31, 3268. The cycle of 7,980 years then repeats, various lunar and solar cycles starting off again in step. Noon on January 1, 1984 is the start of Julian day 2,445,701.

However confused the nomenclature, Mr Wade's program rises above it. I have not tried it out, having neither an Atari nor the time, but line 70 is essentially Gregorian.

R A Fairthorne,
Farnborough,
Hampshire.



Tandy® TRS-80™: Setting The Standard

With Dot Matrix Printers...

9½" Dot-Matrix

£399

- With Colour Computer and Parallel Interfaces

DMP-120. This versatile 9½" dot-matrix printer has high speed data processing and graphics modes, that makes light work of many many tasks. It prints ten and 16.7 characters per inch, or elongated five and 8.3 characters per inch at up to 125 characters per second. A very compact printer it uses fanfold, single sheet or roll paper and has built in parallel and colour computer compatible serial interfaces. **26-1255**

Colour Graphics

£149

- Uses Easily Replaceable Ink Cartridges

CGP-115. Ultra-compact colour graphics printer helps you create beautiful graphics in red, green, blue and black, and it prints alphanumerics. Built-in commands make it easy! Text mode prints 40 or 80 characters per line at 12 characters per second. Uses easily replaceable ink cartridges. A selection of colour pens is available. Set measures 2 15/16 x 8¼ x 8½". **26-1192**

Low Cost Dot-Matrix

£79.95

- Print Graphics and Alphanumerics
- Whisper Quiet!

TP-10 Thermal Printer. Perfect for use with the MC-10 Colour Microcomputer, and our other colour computers. You can print both screen graphics and alphanumerics. Textmode prints 32 characters per line at 30 characters per second on 4⅛" wide thermal paper. Special repeat function to make graphics programming easier. Colour computer-compatible serial interface only (600 baud). **26-1261**

Computer Cassette Recorder

£39.95

- Designed For The TRS-80
- Mains Or Battery Operated

Specially designed for use with TRS-80 microcomputers, the CTR-81 computer cassette recorder is ideal for loading and recording programs and data on cassette tapes. It can easily be connected to Models I, III, 4 and the new TRS-80 Model 100 portable computer. Smart white finish. Mains operation or requires four "C" batteries (not included). **26-1208**

...Or Choose The Daisy Wheel Printer To Meet Your Needs

"Letter Perfect"

£1199

With Free Bi-Directional Tractor Feed (26-1459)

DWP-410. Ideal for SCRIPSIT™ word processing! Select ten or 12 characters per inch, or proportional pitch. Forward and reverse paper feed and ½ line feed, underline and programmable backspace. Includes 1/120" space and 1/48" line feed. Automatic paper set makes paper insertion easy. Uses interchangeable print wheels for type selection. EPM mode for special wheels. **26-1250**

"Letter Quality"

£599

- With Automatic Wheel Positioning

DWP-210. A low-cost printer for that "professional look"! Select ten or 12 characters per inch, or proportional pitch. Prints over 200 words per minute (18 characters per second) at ten characters per inch. Easily handles an original plus two copies, features 1/200" space and 1/48" line feed, ribbon end, cover open and paper empty sensing. With carbon ribbon and Courier 10 print wheel. **26-1257**

This compute to be desig

Only one person could design precisely the right computer for your business.

You.

But unless your name is Clive Sinclair, you'll probably need help from someone with a little more experience.

Like LSI computers. (That's us.)

Computer design starts here, here or here.

Around fifteen hundred pounds will buy you an Octopus system at its simplest.

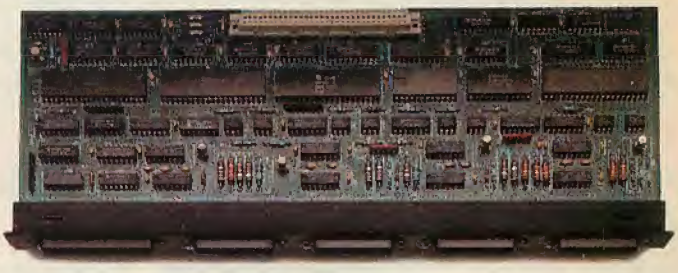
The central computer with a fully programmable keyboard and one disc drive. With the optional carrying case, you can take it home, to business meetings, to your hotel; anywhere a TV screen is available.

A couple of thousand pounds will buy a fully-fledged business computer system, including two disc drives and a high resolution monitor. And, quite free, over a thousand pounds worth of software: a package called 'Axis.'

It's capable of controlling stock, invoicing and keeping your sales, purchase and nominal ledger, and would almost certainly be the first software package you'd have to buy.

We've had seven years' experience of developing micros and software exclusively for business. (You won't find us in primary schools or amusement arcades.)

The result of which is the most flexible system ever offered – Octopus.



For an appreciably greater investment the ultimate Octopus starter kit offers the extra speed and capacity of a Winchester disc drive, integrated with the central computer.

Keep your options open.

This is where your designing comes in. (And the back of the box is where it goes in.)

er is designed ned by you.

We've left room for four option boards and are offering, already, a choice of seven.

For example, a telecommunications board facilitates all kinds of links through the standard Telecom network.

A graphics board conjures up all kinds of shapes and sizes.

Others offer colour display, expanded RAM, links for printers and other peripherals and, ultimately, the ability to connect up an entire Octopus network.

And because you'll be able to get up-dated option boards, the Octopus system means you can keep your options open for the foreseeable future.

Better by a Zilog.

With all this inbuilt flexibility, we had to be doubly sure about the abilities of the central processor.

So we included two of them.

Namely the Intel 8088-2 and the Zilog Z80B.

In plain English (well, plainish), this means Octopus can operate both the tried and tested 8-bit programs and the new, faster 16-bit ones; even, if necessary, switching between the two.

It can also speak five languages or more and work on any of five operating systems.

Which adds up to the fact that Octopus will accept virtually all of the business micro software that's currently on the market.

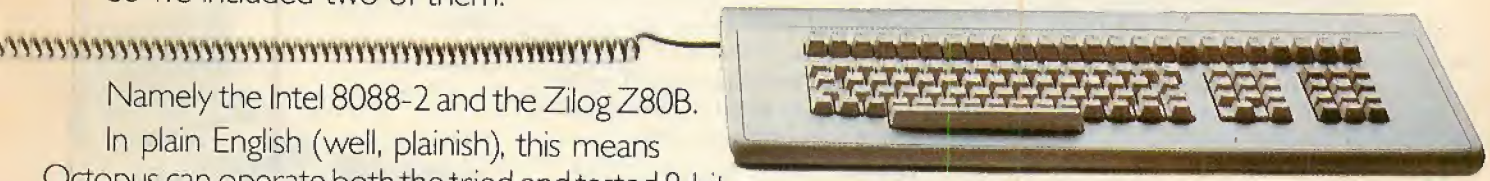
Hard-nosed software.

Not that we let that stop us from designing our own. And designing it better, with the kind of thoughtful detail that makes for real convenience.

For instance, we provide a mat to lay over the keyboard when its function keys are re-programmed. So you won't have to re-train staff to use a keyboard that says one thing and means another. Or re-train them whenever you up-date or expand the program.

An advantage, we might add, which you could only enjoy with a computer system that doesn't become obsolete or outgrown.

No matter what size of business you've got designs on.



Please send me details of the Octopus computer system.

PC7/84

Never before has so much been available from so little, to so many.

Never before in the history of modern computers has there been available a totally portable machine with the ability to cope with so many demands, to so many people, in so many different business areas.

Epson, with over 20 years experience in designing and manufacturing high quality printers, have produced the HX-20, a precision machine with its own rechargeable power supply that can be used for just about any task within todays discerning business: from data capture to word processing, from card indexing to sales order entry. Communicating with other machines is no problem and the HX-20 is easily coupled to one of our fine printers. You can even link in another main computer system by using an acoustic coupler.

Don't be fooled by its size, the HX-20 has all the software back-up you'd expect from a much larger machine and incorporates many "bigger computer" features – 16k RAM expandable to 32k with serial interfaces, a full size typewriter keyboard, it's own built in LCD screen and a dot matrix microprinter. A micro-cassette facility is available as an optional extra.

A complete computer that will either stand on its own or could be the obvious extension to your existing system.

More and more people are finding out just how big the small compact HX-20 is. Why don't you find out for yourself – you owe it to your business.

EPSON

Extraordinary product. Exceptional quality.

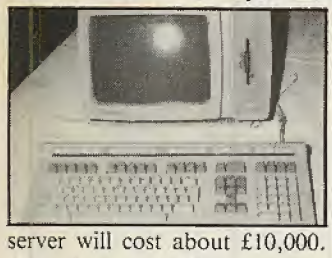
● Circle No. 106

Intertec Headstart

INTERTEC'S 16-bit Headstart, successor to the Superbrain, is now distributed by Icarus in the U.K. Combining eight- and 16-bit processors, the machine offers one 0.5Mbyte micro-floppy as standard, together with 512K RAM. Both can be upgraded to 1Mbyte. A key feature is the RAM-disc option whereby the RAM may be partitioned into a virtual-disc area.

The system has been built with networking in mind. Four stations and a 10Mbyte file



server will cost about £10,000. The basic 512K system, complete with 12in. screen and detachable keyboard, costs £2,895 plus VAT.

Further details from Icarus Computer Systems Ltd, Deane House, 27 Greenwood Place, London NW5 1NN. Telephone: 01-485 5574.

Koala graphics

A GRAPHICS PAD for the Commodore 64 has been produced by Audiogenic. The Koala Painter allows colour graphics to be drawn, stored and manipulated using menus of commands. As well as drawing with a stylus on the 4in. by 4in. pressure-sensitive pad, standard routines for lines, circles, etc. can be called, and colours added successively. Individual portions of the

screen can be blown up and worked on in detail.

The system is disc based and costs £89.95 including VAT. The curious name apparently stems from the original American designers. Further details from Audiogenic Ltd, PO Box 88, Reading, Berkshire RG1 2SN. Telephone: (0734) 595647.

Bromley's Superstar

SUPERSTAR 16 is a 16-bit multi-user system from Bromley Computers. It has an interesting dual-processor architecture surrounding a 16-bit master processor. Multi-user units can be added by buying additional eight- or 16-bit processors which plug inside the main Superstar unit. Terminals are then connected and may be run as independent systems. This contrasts with the normal system of distributed processing power in the terminals.

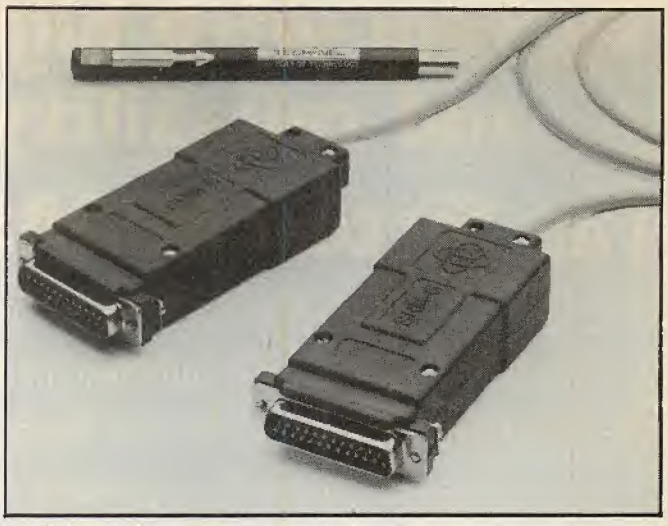
The new machine runs CP/M, MS-DOS and Xenix. Bromley Computers has

produced a range of applications software.

The entry system comes with an eight-bit slave, 10Mbyte Winchester, one 400K floppy, screen and keyboard, and costs £2,450. Up to 16 users can be accommodated sharing a Winchester storage capacity of 160Mbyte. Further information from Bromley Computer Consultancy Ltd, 417-421 Bromley Road, Bromley, Kent. Telephone: 01-697 8933.

Micro modem

A NEW low-cost ultra-miniature modem measuring just 4.5cm. by 2.2cm. By 10.6cm. has been produced by Tech-Nel. Designed for short-range data transmission up to 25km., the unit requires no power supply or batteries.



The modem plugs directly into the standard RS-232C port and is powered from signals emitted by the host machine. Transmission rates of up to 19,200 baud are possible. A pair of SRM-6 units costs £140. Contact Tech-Nel Data Products Ltd. Telephone: (0295) 65781.

Removable Winchesters

COUNTRY COMPUTERS has extended its range of computers with the C-3010, featuring one fixed Winchester and one removable cartridge version. This particularly lends itself to security-sensitive data and situations. The Z-80A system can be expected to run with 192K RAM using bank switching. A multi-user version is also promised later in the year.

The 5+5Mbyte system costs £4,500 plus VAT; a 10+10Mbyte version is planned.

More details from Country Computers Ltd, Pipers Road, Park Farm Industrial Estate, Redditch, Worcestershire B98 0HU. Telephone: (0527) 29826.

Xmas cheer

AT A SPECIAL ceremony held to celebrate the millionth Spectrum rolling off the production line on December 9, Sir Clive Sinclair was given his Christmas present a little early. Yes, it was a Spectrum.

Oric also obtained a useful Christmas bonus in the form of £4 million raised through its new parent company called Edenspring. The money will fund new developments and a substantial advertising campaign.

A multi-user CP/M compatible system with high performance and reliability.

The Sirton MIDAS-MPS

Sirton Computer Systems' new Distributed Processing System; MIDAS-MPS, has been specially designed to be a flexible, multi-user system. Each user terminal added to the system has its own local processor, expanding the computing capacity of the system. The MIDAS-MPS is CP/M compatible,

has sophisticated password protection, it is easily installed and, as with all our systems, reliable.

If you'd like to learn more about MIDAS-MPS why not write or 'phone for our leaflet which includes full specification. We'd be pleased to help you with your enquiry.

Features:

- ★ CP/M Compatible
- ★ Multiple Directories with Hierarchical Access
- ★ Easily Expandable
- ★ High Throughput
- ★ High Speed Communication
- ★ Individual Processors at each Terminal
- ★ Easily Installed
- ★ Reliable
- ★ User Friendly

SOFTWARE AND TECHNOLOGY 4

A disk for every micro. While 8-bit micro-computers may boast a 'standard' operating system, one of its gravest shortcomings has been the lack of a common disk format. It has meant that data created with the same software package but on different computers could not be moved from one machine to another running the same operating system. With 16-bit micros running MS-DOS, this situation has been remedied. MS-DOS uses one data format common across all machines. This means that files from Multiplan or documents from Microsoft Word are completely transferable between any MS-DOS micros.

Enhancing high-level languages. Today's computer hardware offers a staggering array of new facilities, particularly where graphics and sound are concerned. As hardware develops, software writers have a choice between buying a special package just to achieve the most rudimentary on-screen graphics or music, or using a high-level language with built-in graphics and music commands. In fact, it would be foolish to expect proven languages like BASIC not to evolve as hardware becomes more sophisticated. With the latest version of its GW BASIC Interpreter, Microsoft has enhanced BASIC one step further for this new hardware. The language has a large number of graphics and sound extensions supporting new input devices such as joysticks and light pens, with graphics commands that can rotate defined objects at will on the screen, and the ability to open windows and see objects shrink or expand automatically as window sizes alter. The combination of advanced hardware and software like GW BASIC means that programs written in Interpretive BASIC can now run at speeds approaching those of programs written in lower-level languages. Features of this type would have been unheard of two years ago – but just think what sort of facilities may be available in tomorrow's high-level languages.

Europe's leading Financial Planning package. Even though the European Economic Community sometimes finds it hard to agree just who pays how much to whom and for what, it has at least reached a firm decision on one aspect of financial planning. When it comes to spreadsheets there appears to be great accord between France, Germany and the UK. Microsoft's Multiplan, translated to work in the natural languages of those countries has come out as the number one European spreadsheet package. According to a recent European survey in one of the monthly computer journals, Multiplan has emerged as the favourite spreadsheet. Microsoft has brought the same linguistic resources to bear on Word, its text processing package, and hopes that in 1984 Word will achieve the same international success as Multiplan.

How does a standard evolve? The microcomputer industry has traditionally established its standards by two routes. The S-100 bus, MS-DOS and 8-bit CP/M evolved while some manufacturers have consciously attempted to set standards as with the Ethernet network and the 3.5" Winchester disk format, hoping that others will follow in their footsteps. There has, however, recently been a new approach. At the end of 1983, an unprecedented commitment was made by 23 of the industry's leading microcomputer manufacturers to a new product from Microsoft. The product was Microsoft Windows – an enhancement to the MS-DOS operating system. Never before in microcomputing history has such a forceful public committment been made to one product. Companies like DEC, Wang, Tandy, Apple/Rana, Altos, NCR, Compaq, TeleVideo and Eagle will all be offering the product on their MS-DOS based micros in 1984. More recently, the UK's leading 16-bit microcomputer manufacturer, ACT announced that it too, would be supporting Windows on the hugely successful Apricot. By mid-1984 we will be reaping the benefits that such standardisation offers – portable software running in the same manner on different machines; integrated software with different applications running together on the same machines; and software that's a whole lot easier to use.

● Circle No. 111

Digital Research's new language strategy

DR FORTRAN 77 is the first of five planned new language compilers from Digital Research. Pascal, C, PL/1 and CBasic compilers will follow shortly. All these languages will use a new compiler writing technique which promises to increase the portability of application programs between systems, and to make new language compilers available more quickly across the range of microcomputers.

A major problem facing a system-software company like Digital Research is the number of different operating systems and processors used on microcomputers. Suppose seven language compilers were to be produced to run under, say, four different operating systems on micros built around the 8086, 8088 and 68000 chips. This means producing, if not quite 84 separate products, still a large number of completely different pieces of code.

Digital Research's new approach is to split each compiler into two, with a front-end syntax processor and a back-end code generator. This way the front-end syntax processor only has to be written once for each language. The Digital Research front-end processors all generate a common intermediate language. This CIL code is then fed into the back-end code generator for each operating-system/processor combination to produce the final optimised machine-code program.

Although this approach is not new — it has been used with mini and mainframe languages for years and is reminiscent of the Pascal p-code system — Digital Research's across-the-board use of the technique represents a further growth of professionalism in the microcomputer software market. The advantage to language users claimed by Digital Research is that source code written in a given language on one system will work across the complete range of micros.

Designed for scientific and engineering programmers, DR Fortran 77 supports 32-bit real numbers and runs programs up to the 1Mbyte addressing capacity of the 8086 and 8088 processor family. On smaller systems large programs can be overlayed in 128K chunks. Digital Research says the new compiler is a full implementation of the ANSI-77 Fortran standard.

Concurrent CP/M and CP/M-86 versions should be available immediately, and MS-DOS and IBM PC versions are promised for March, priced at £385. Further versions will probably follow, with Unix high on the list.

These products will be available through retail channels, but if you require further information Digital Research's telephone number is Newbury (0635) 35304.

Commodore/ Atari program generator

HOME FILEWRITER is a program generator for disc-based Atari and Commodore 64 systems. It will be most useful for database applications. The user types a layout on to the screen and Home Filewriter then generates the necessary code. A typical application would be club membership records.

Home Filewriter costs £39.95. Details from Dynatech Microsoftware, Rue du Commerce, Bouet, St Peter Port, Guernsey, Channel Islands. Tel: (0481) 20255.

Applesoft compiler

THE EINSTEIN compiler is for Apple IIe and Apple II Plus disc-based systems. It is an optimising compiler for translating Applesoft Basic programs into Apple machine code. The £89 utility program supports the full range of Applesoft and DOS 3.3 commands, including high- and low-resolution graphics and shape tables.

Details from Pete and Pam Computers, New Hall Hey Road, Rossendale, Lancashire BB4 6JG. Telephone: (0706) 212321.

Version 3 of The Last One

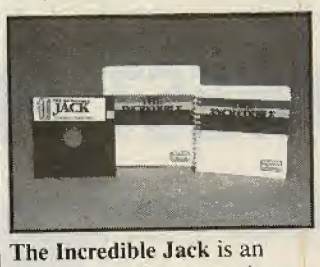
VERSION 3.0 of The Last One — which must surely be a contradiction in terms — is now out. The Last One is a program generator, and one of the most heavily publicised programs of all time. Version 3.0 has several enhancements, including the ability to have final programs in any national language. It costs £330 for the IBM PC, Apricot, Sirius, DEC Rainbow, Orion and most CP/M machines, and £199 for the Apple II Plus and IIe.

Version 2.0 of The Last One is still available for the Commodore 64, with disc drive, for £85. Contact D J AI Systems, Station Road, Ilminster, Somerset TA19 9BQ. Telephone: (04605) 4117.

(More news on page 23)

In brief

Battle 1917 is a World War I strategic simulation game for several players, running on the Spectrum. The price is £6 from Cases Computer Simulations. Telephone: 01-858 0763.



The Incredible Jack is an integrated software package for the Apple IIe. Word processing, calc, filing and mailing are all integrated and run off one disc. The price is £129.50 from Pete and Pam Computers.

Base Invaders is a game with a more modern scenario. You have to dodge policemen and cut down the fence at Greenham Common to get to the cruise-missile bunkers. Running on the Sinclair Spectrum or BBC Micro it costs £8 from Magination. Telephone: Newcastle (0632) 653224.

Total Health for the Commodore 64 helps you plan a balanced diet and exercise program. Tape and disc versions cost £17.95 and £19.95 respectively from Marketing Micro Software Ltd. Telephone: Ipswich (0473) 462721.

Epson has issued a free brochure explaining how to get the best out of its printers when connected to the BBC Micro. Telephone: Freephone Epson.

The Graphics Solution is a graphics editor and animation system for the 64K Apple II Plus or IIe with disc drive. It lets you prepare mixed text and high-resolution charts, three-dimensional graphs and animated sequences. It costs £99 from Pete and Pam Computers.

Compilers for Commodore Basic

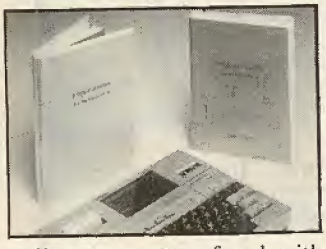
OXFORD COMPUTING SYSTEMS has launched a range of disc-based Basic compilers covering the whole Commodore range. Most interesting is Portspeed, costing £125, a cross-compiler generating Commodore 64 machine-code programs from 8000-series Pet Basic source code.

Petspeed, also costing £125, is a conventional compiler for 4000- and 8000-series Pet Basic. It optimises the output machine code, ensuring that the resulting programs are not prohibitively long, a problem with non-optimising compilers. Oxford Computing Systems also has a £75 Integer Basic Compiler for 3000-, 4000- and 8000-series Pets.

Contact Oxford Computer Systems, Hensington Road, Woodstock, Oxford OX7 1JR. Telephone: Woodstock (0993) 812700.

HX-20 nominal ledger and cash register

PHIPPS ASSOCIATES has produced a nominal-ledger package for the battery-powered portable Epson HX-20. It can analyse accounting data over 100 headings. The audit trail is produced on the Epson's built-in printer. Phipps says the program, which costs £26, is suitable for the travelling



auditor or anyone faced with a complicated multi-column epxense sheet.

Phipps Associates also does a program called Cash Register, which turns the HX-20 into a point-of-sale terminal. Used in conjunction with the Epson bar-code reader package it can be used to read EAN/UPC-coded labels directly from products. Another option is a cash drawer which links to the HX-20 through its remote On/Off socket. Phipps Associates says the program is also likely to appeal to van salesmen.

Further details from Phipps Associates, 172 Kingston Road, Ewell, Surrey KT19 0SD. Telephone: 01-393 0283.

K-tel double-siders

K-TEL, of TV-advertised record fame, is launching a series of TV-advertised Spectrum and Vic-20 games. Under the slogan "twice the fun with two on one"

the programs will come two at a time on a double-A-side cassette for a price of £6.95.

The initial five cassettes include It's only Rock 'n' Roll plus Tomb of Dracula, and Battle of the Toothpaste Tubes plus Castle Colditz, both for the Spectrum, with Supavaders/Bomber Run for the Vic. Commodore 64 programs will follow in a later batch.

The programs should be readily available at the usual retail outlets. Otherwise contact K-tel on 01-992 8055.

Hands-On training packs

HANDS-ON MULTIPLAN and Hands-On dBase II will be the latest additions to the Hands-On range of self-teaching micro-computer-training products. Although prices have not yet been announced, the packages should be available in early 1984.

Hands-On CP/M Plus, Hands-On MS-DOS 2 and Hands-On CP/M 2.2 are already obtainable, price £80, for the majority of computers running these operating systems. Hands-On Basic, based on Microsoft MBasic, and Hands-On Cis Cobol, cost £150.

The Hands-On range all use a split-screen technique. The top half mimics the product in question while the tutorial guide runs in parallel underneath.

Details from Vector International (U.K.), 64A Lower Teddington Road, Kingston-upon-Thames, Surrey KT1 4ER. Telephone: 01-943 1257.

Home word processor

HOMEWORD is Sierra On-Line's new word processor designed especially for the home user. The program has fashionable features like graphic icons and can be used with an optional joystick to achieve a mouse-like effect cheaply.

Homeword is intended to be easy, and it comes with an audio cassette explaining how to use the program. Available now for the Apple II Plus and IIe, price £33.95, versions of Homeword are also promised for the Atari

and Commodore 64. Contact Pete and Pam Computers. Telephone: Rossendale (0706) 212321.

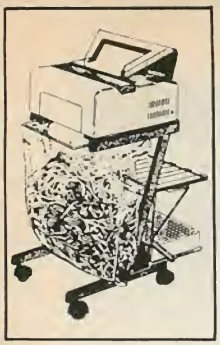
Expert systems from Acorn

BRIAN ALDISS on Science Fiction, Sheridan Morley on Theatre, Steve Race on Music, John Julius Norwich on History, Anthony Holden on Royalty and Julian Symonds on Crime: each of Acornsoft's Grandmaster Quiz series each presents 300 questions compiled by one of these experts on their specialist subject area.

The quizzes can be played competitively between two people or alone against the machine. The six programs cost £12.65 each, including VAT, and run on the BBC Model B — or the Acorn Electron, if you can get hold of one.

Details from Acornsoft, 4A Market Hill, Cambridge CB2 3NJ. Telephone: (0223) 31640.

Beebfont is a character ROM for the BBC Microcomputer which gives you five pre-defined 16-by-16 dot founts and facilities to define your own. Founts can be displayed on the screen or printed on an Epson printer, according to the supplier, Watford Electronics. Beebfont costs £45 for the ROM, manual and supporting disc or tape software. Details from Watford Electronics, 33/35 Cardiff Road, Watford, Hertfordshire WD1 8ED. Telephone: (0923) 40588.



Shredders for computer printout

The increasing use of word processors, printers and computer installations means that Business Aids' electronic Scimitar Data Shredders are in greater demand than ever. The Compact Data 1001 is ideal for the smaller computer user; models 2001 and 2002 accept 25 sheets or eight streams of continuous stationery, while the high-security 2002XC converts paper into illegible 2 × 15mm chips. Data 4001 is a wide-throated console model; the heavy duty Data 5000 and 6000 have a 30-sheet capacity and process up to 20 streams of printout simultaneously. Contact me now.

Clear crisp copies

If you require needle sharp, edge to edge copies, clear black and white from virtually any colour, the Roneo 230 Copier from Roneo Alcatel will suit you. It produces 30 copies per minute, has a touch sensitive keyboard to minimise misfeeds and a key control to monitor usage. The 230 will copy standard documents, books, flimsy originals, even three dimensional objects, onto standard bond, address labels, etc. in sizes A3, A4, B4 and B5. An automatic sorter and feeder are also available. Contact me for further details.

428 on enquiry card

A fast and efficient mailing system

If your computer can produce invoices in a matter of minutes it seems crazy to then spend hours mailing them by hand. The Neopost System Five-2 from Roneo Alcatel is designed to fold, insert, seal and frank in a fraction of the time it takes manually. The 'system' can be controlled by a single operator saving many costly man-hours and its modular construction gives it the flexibility to match your needs exactly. If you're interested in saving time and money circle this number today for more details. **429 on enquiry card**

A cut above the rest . . .

Continuous stationery can create as may problems as it solves, with paper-cutting bottlenecks holding up output. But according to Bell & Howell their Fimafold 1000 provides a low-cost solution for small or medium computer installations. The accent is on ease of use and maximum versatility, with electronic control systems keeping the operator fully informed and in complete control. Interested? Circle the number and I'll be happy to send you full details.

Dictation: let's talk

One of Dictaphone's most advanced portables, the 324 gives you a full two hours' recording on a cassette one-third the size of the standard C-type. So it's a handy and convenient way to catch up with that backlog of correspondence when you're out of the office. You can even use the 324 as a note-taker at meetings. Press the conference button and you've got an instant record of the main speaker's voice. All this in a machine that measures a mere 4½ × 2¼in. I have full details.

IS POOR SOFTWARE KEEPING YOU POOR ?

A good tool is worth its weight in gold.

GOLDEN TOOL

software for the 64.

CREATE YOUR LIFE MORE SUCCESSFUL!

SM TEXT 64

The professional text processor with more than 80 functions to aid productivity; multi-colour display; up to 120 columns without extra hardware; search & replace; enhanced block handling; direct access to addresses in CUDA files; etc etc

ONLY £50

SM CUDA 64

Your professional standard, personal address filing system. Direct access to 620 addresses per disk; 5 extra lines per address for comments; totally menu-driven; powerful editing and back up facilities; several hardcopy facilities.

ONLY £40

SM KIT 64

The famous programming tool for Commodore micros. Extends BASIC – merge, find, re-number, dump, trace, enhanced floppy monitor (disk doctor), highly efficient machine language monitor with built-in assembler, disassembler, trace, and many other helpful features. A real golden tool!

ONLY £40

SM ISM 64

This index sequential file manager gives you a new dimension on direct access file handling. Up to 40 keys, variable record lengths, simultaneous handling of 10 files. How can you program without such a tool?

ONLY £40

SM MAE 64

The definitive tool for the would-be master of the 64. If you are ready for programming in assembler, buy it now. Not for beginners, this tool will help you to fashion masterpieces of the programmer's art. Coexists with Commodore BASIC.

ONLY £40

PLACE YOUR ORDER NOW!

If your Commodore dealer cannot supply, contact us direct. Cheque with order please. Prices include vat, packing and carriage within the UK. Allow 7 days for delivery. All programs on disk and described in detail in a manual.

Prices firm to end 1983

The All-Purpose System

The MTX Series is a new departure in micro-computer technology. Whether your needs as a user are for personal programming, games playing, scientific or process control, educational or business use the MTX Series is already capable or very easily adaptable to almost every application. Glance through the standard features below - you'll see what we mean.

Hardware - 32K RAM on the MTX500, 64K on the MTX512.

The MTX500 has 32K of user RAM as standard (64K on the 512), expandable to 512K plus 16K of video RAM, controlled by a separate Video Processor. Sixteen colours, 40 column text, 256 x 192 high resolution graphics with all sixteen colours available, and 32 easily moveable user defined graphics characters (Sprites) combine to make effective screen displays quick and simple to achieve. Standard outputs are centronics printer port, two joystick ports, an uncommitted I/O port, 2400 Baud Cassette port, separate TV and Video Monitor ports, 4 channel sound with hifi output plus a dedicated cartridge port. Other standard features include the Z80A processor running at 4MHz, real time clock, full moving key keyboard with 79 keys including eight 2-function keys and separate numeric pad.

Software

The MTX's 24K ROM contains several languages and routines which enable the novice or the experienced programmer to make full use of the machine. Standard languages are MTX BASIC, MTX LOGO commands, NODDY. ROM routines include an ASSSEMBLER/DISASSEMBLER with screen display of the Z80 CPU registers, memory and program,which can be manipulated from the keyboard. Machine code programs can be stepped through one instruction at a time, and easily called from within BASIC programs. A further feature is the Virtual Screen facility which enables the programmer to split the screen into a maximum of eight sections to work independently whilst maintaining all full screen facilities. Pascal is available as an add-on ROM pack.

The Disc Based Computers from Memotech

Designed to use the full power of the MTX computers the FDX and HDX make perfect business systems at prices which make perfect business sense. Both feature the CP/M operating system, giving instant access to a wide range of proven application software. Available in October these feature:

- *Full Western Digital floppy disc controller set with SASI interface for 4 drives, CP/M types 0-13.*
- *minimal latency, very high data transfer rates*
- *optional Colour 80 Column Board*
- *optional Silicon Discs (1/4 Mb) which dramatically increase the efficiency of 8 bit software to those of 16/32 bit software; increases life and reliability of mechanical drive*
- *permits single disc CP/M operation*

FDX— Floppy Disc System

1 or 2 5 1/4" Qume drives 500K unformatted, 347K formatted,

HDX— Hard Disc System

5 1/4" Qume drive, 500K unformatted, 347K formatted,
5 1/4" Winchester which may be 5, 10, or 20 Mb

All Memotech products are designed and manufactured in Oxfordshire, England

MEMOTECH
MTX
SERIES

CONTINENTAL SOFTWARE

We're not just playing games...

BLOBBO
A fast maze chase with untold perils and hazards.

TOADO
Get the toad back to his nest – but don't get run over or drown on the way.

SUPER MINEFIELD
You may have seen other Minefield games but ours has tanks that lay invisible mines, and spiders that are *very* tricky to avoid.

CONTINENTAL INVADERS
Classic arcade action, with all the features that make this game so popular.

KILOPEDE
This one is very fast – its not easy to get past level two.

RADAR/SONAR
Eliminate submarines with a combination of radar screen and sonar, very realistic.

FLIGHT SIMULATOR
Take off, navigate and land your high powered light aircraft. All the features of true flight.

ALSO AVAILABLE:
RESCUE, BEAVER, CONTINENTAL RAIDERS, PILE UP, SIGNAL MAN and many more.

we mean business too.

MTXCALC
Sophisticated and powerful, the professional spreadsheet program.

MTX WORD PROCESSOR
All necessary features are included to give a powerful business tool.

ACCOUNTING PACKAGE
Sales and Purchase Ledgers, stock control, payroll – the complete business system.

PROJECT PLANNER
Speaks for itself, and helps you achieve deadlines efficiently and effectively.

STRATEGY BOARD GAMES
CHESS, BACKGAMMON, OTHELLO, DRAUGHTS.

EDUCATION PROGRAMS
MATHS 1 PHYSICS 1
The first two programs in a series of specially written software designed to teach at the pace and level best suited to the user.

Software for the MTX SERIES

CONTINENTAL SOFTWARE UNIT 24 STATION LANE WITNEY

The shop of things to come

Glyn Moody discovers how a national chain store is planning to deal in business micros.

BY NATURE business people and professionals are a cautious lot, and never more so than when it comes to buying computers. Torn between a fear of being left behind in the micro race on the one hand, and on the other of being taken for an expensive ride, many small businesses have held back from the initial plunge. The activities of a minority of cowboy dealers have threatened to shake people's confidence in buying for business.

Any scheme that aims to provide a total service for the keen but careful business user is to be welcomed, and should help to allay these fears. The Debenhams group hopes to have done just this. Greens Business Systems, a wholly owned subsidiary of the well known chain store, officially launched its micro service to businesses. It is claimed to be unique, and certainly incorporates a number of interesting ideas.

The centres are not independent shops but will be placed in existing Debenhams stores as self-contained sections distinct from the general hurly-burly. Debenhams' market research shows that business users are reluctant to go to conventional dealers, but no such reluctance has been found in the more free-ranging atmosphere of large department stores. Greens hopes to capitalise on this, though acknowledging an initial credibility gap: after all, who would expect extensive business-micro expertise in the store you go to for a pair of tights or a new saucepan.

A key feature of the new project is Debenhams' reputation — according to those market researchers again — for reliability and stability. To reinforce this idea of dependability, Greens offers the following ingredients in its standard micro package:

1. Extensive professional expertise, both in the form of sales advice and free seminars. Using the stores' existing training and catering facilities, Greens provides free evening seminars on such subjects as micros in business, the ACT Apricot and the IBM PC.
2. Authorised dealerships from IBM, Apple and ACT. IBM has scrutinised the scheme and has so far granted dealerships to centres in four stores.
3. A full range of training programmes backing up the machines and software available. There are 28 different courses ranging from introductory micro-appreciation sessions to two-day courses on using dBase II. The cost varies from £75 to £100 per day.
4. Installation with on-site training. The aim is, not unreasonably, to leave the end-user with a fully working system, and with enough knowledge to run it.
5. A 24-hour maintenance service. In addition to running a help-line phone number, Greens guarantees that an engineer will visit within 24 hours of a call being made. Maintenance for a typical Apricot system from Greens will cost about £150, excluding parts; maintenance contracts can be taken out at current rates for up to four years.
6. The Debenham's "price promise" is offered. If a customer can find the same equipment on offer locally at a lower price, he or she may return within seven days and Greens will match it.

Leasing options are also available; a typical Apricot system, for example, would cost around £54 a month. It will be possible to trade in a leased computer for a newer model merely by increasing payments.

Initially seven Debenhams stores operate the business-micro scheme — those at Oxford, Harrow, Romford, Guildford, Southampton, Staines and at Harvey Nichols in Knightsbridge. The Guildford store has been running as a prototype since March 1983; the rest followed six months or so later.

Greens is at pains to emphasise the complete separation from the cheaper games-oriented sector. Through in-store centres and travelling representatives the company sees itself as offering complete professional systems. Only four machines are currently sold: Apple II, ACT Sirius and Apricot, and the IBM PC, a choice which has been largely dictated by the range and availability of software. The software itself is restricted mainly to broad applications systems rather than specialised vertical-market packages.

The frequent reference to the ACT Apricot is no accident. Greens' joint managing director Michael Milman waxes lyrical about the machine, and goes so far as to suggest that it could do for the U.K. business market what the IBM PC did in the U.S. To back this up he points out that the average attendance at Apricot seminars has been running at over 50, and already over 100 machines have been sold by Greens alone.

Whether this prediction turns out to be true or not, Greens is certainly thinking big. The first target turnover is £10 million, and the plan is to have 20 centres open by the end of 1984 with another 40 a year later, eventually taking space in non-Debenham stores. According to Milman, Greens intends to become the biggest dealer in the U.K. So next time you need some business micro equipment it could well be worth looking in your local department store.

G. W. COMPUTERS LTD LONDON'S WEST END NATIONWIDE OVERNITE SERVICE MORE PRODUCT RANGES BETTER SERVICE PROBABLY THE WIDEST SELECTION OF NETWORKS...
MICROS...AND PRINTERS ON DISPLAY NATIONWIDE

*****THE NEW DBMS III (series III of the world's first 'task-robot-programs')*****

*****FEATURES*****

1400 character record sizes	32000 records per filename	12 online file architectures
mathematical scratchpad	20 main/200 sub fields per record	240 fields using cross-referencing
record relational indexes	field and record related formulae	cross-record calculations
translateable to any language	'Jump-to' any of 32000 records per file	'Jump-to' any record in 12 files
User-defineable reporting	random/binary/key/multiple field search	User-defineable files/field words/sizes
field protection/classification	'if-then' questioning	endless 'either-or' matching
either-or. same as. greater. smaller	file protection/password entry	formulate/recall on selection criteria
sorts 'alpha or numeric' any window	range match. not match. integer match	13 interrogation question types
12 online file architectures	sort speed 500 records per 20 seconds	short filing output/audit trails
		Word-star & Mbasic compatible

DBMS III.7 NEW SWITCH MODE FACILITY ENABLES YOU TO CROSS UP TO 12 DIFFERENT FILES (32000 RECORDS PER FILE) PRE-SELECTING ANY OF UP TO 20 FIELDS PER RECORD/FILE FOR DISPLAY/PRINT OUTPUT (240 FIELDS) IN ALL. ONE MASSIVE ENQUIRY CAN PASS THROUGH 384,000 RECORDS

You might have two files whose records are directly related to each other, so that the first file (say containing names and addresses) refers to the second file (say financial and other information relating to the same record numbers in the first file) directly. Then you can simply select that in file 1 you are interested in just the name and telephone numbers, whereas in file 2, you are interested in the income, trading period and number of branches, information. Your enquiry can then pass through both files highlighting that information only. Actually there doesn't need to be a strict correlation between the same record numbers in different files, and you can also on just one JUMP command go to any record in any of the 32000 records in any of the twelve files and carry on cross-referencing from there onwards.

DBMS'S MACROS WORK FROM THE MOMENT YOU INSERT THE 'TASK DISK' IN THE COMPUTER

Simply design your file, give its fields your words, setup your report mask, and then enter your records. Switch to 'automatic drive' and formulated any task you wish to program to fulfill, the task is stored as a macro. Take a copy of the program on another 'task disk' and from then on, the task disk will function without a single key-stroke. Think of a number of such 'task disks' such as "stock-re-order reports"; "stock-valuation reports"; "analysis"; "patient history analysis"; "research-analysis"; "budgetting-analysis"; "vehicle-location control"; "librarian analysis"; "plus more?"

Not only does this program surpass most of its kind that you might buy elsewhere, but if you buy the hardware from us, then you get it FREE . . . DBMS II (WITHOUT MACROS) AND DBMS III ARE FULLY IMPLEMENTED UNDER CPM-86 (tm) AND MS-DOS (tm) I.E.: SIRIUS/VICTOR/IBM DBMS II IS £395.00 (or £250.00 by mail order ex. training) . . . DBMS III is £575.000 (or £295.00 by mail order ex. training).

AN IMPORTANT ANNOUNCEMENT FOR POTENTIAL SYSTEM BUYERS

Any serious buyer knows that although the HARDWARE and SOFTWARE are both inter-dependant, the choice of software is CRITICAL to the consequence of having useless piece of hardware nor not.
With this in mind our standard system deal gives you the software free with a system purchase. However, if you want more!

NOW we have a piece of software that is a challenge to the highest state of the art on micro-computers today. It's the first of its kind world-wide. It is called THE KEY, and it will unlock the power of your micro to the limits of your imagination. It is very expensive however, because it is the first to embody many features of other programs, in one single program that has over-lapping functions. It costs 995.00 Stg., and is available with a system purchase.

it features, the entire list of functions already covered by our program called DBMS III.7a to be seen elsewhere in our advertisement. PLUS. + + + + + + + + +
Paint any form including upwards from 100 (depending upon size of ram in hardware) data fields on the screen. Screen width up to 250 columns. Page lengths 100 lines.

The form might be a letter where data fields on the screen. Screen width up to 250 columns. Page lengths 100 liens.

The form might be a letter where data fields are name-addresses. Search files and accept any fields on teh database into any fields on the letter. The form might be a spreadsheet, where searches call records (in columnated style) from the database and perform calculations, the difference here is that unlike other 'calc' programs giving you 254 lines per spreadsheet, THE KEY gives you 32000 lines if your database has that many records.

The standard attributes of any field, allow you to SEARCH OTHER FILES for fields to accept into any field on the current form, plus allowance to POST OTHER FILES any fields from the current form into any fields on that file. RELATE TO AS MANY OTHER FILES, as the number of data fields you have on the master form. Make data fields CALCULATE AGAINST FORMULAE, and other data fields. VALIDATE DATA INPUTS criticially character by character; numerically, alphabetically and date-wise.

NO MANUAL NEEDED, all help menues accessible by hitting 'esc' at any point in the three major modes of activity (create, data entry, data query).

You can set up dozens of individual files that eventually are inter-connected through one master form; like an invoice, order, personnel-file, stock control, mail-shot. The master form may at every juncture of a data field, go outside the current form to supplementary forms for data retrieval, or post-filing.
Come along the computing road with us. We're out in front so you'll get the best there is at the price. On IBM and SIRIUS.

The first robot-concurrent-forms-database-text-processor-spreadsheet-no-manual-all-in-one-program.

G. W. COMPUTERS LTD — Tel: 01-631 4818

Contains the highest state of the art software available today

FORMS/TEXT/CALC/DBMS IV ALL IN ONE PROGRAM — "KEY" — at £995

When you budget for a complete system of software you eventually end up with a host of packages like, Sales, Purchases, Nominal, Data, Text, Calc, Mailshot, Invoice, Order, Workflow, Personnel, and so on.
The list is endless and the outlay several thousands of pounds.

Features. Design a form as wide as a window of 250 characters, long as needed. Cursor movements are 'left, right, up, down, delete left delete right, tab right-left-up-down' Paint your form as you like directly on the screen.

Text..... Write a letter as you see it on the screen, edit it then simply enter ^P to print.

Calc..... Set into the form, your data fields, "£££££" and specific file-related activities, formulae and validation checks.
Enter values and see the spreadsheet calculate itself.

Database. Search files for data to be inserted to fields specified.
All the features of DBMS III, explained elsewhere in our ad.

Here's an example of an invoice you might design for your stationery .....
You could design your own spreadsheet, order form, statement, or any other kind of form that is required to fit your existing stationery.

INVOICE <0>£££££££££££

To £<1>£££££££££££

<14>£££	<15>£££££££££££££	<16>£££	<17>£££	<18>£££

and so on...

Total...<19>£££££ Tax...<20>£££

<??> items <1 >to <5 >internal command to request name input, and then search an address file for details.
<??> items <6 >to <7 >request date input and validate.
<??> item <8 >request agent number and validate range.
<??> <9 >request quantity, validate range.
<??> <10>request description, search file, accept, and calculate fields <11>, <12>, <13>, if finished invoice then calculate fields <19> and <20>

Now comes the more valuable facility, you can provide the 'FORM' with file-related instructions, not only to request a 'console' input for a file search against names, and stock, but after the invoice is finished the fields you have selected may be passed to related files.

EG: Send fields <0 >, <1 >, <6 >, <7 >, <11>, <12>, <13>, <19>, <20> to a sales ledger.
Then send fields <9 >, <10>, <11>, to product analysis file.
Then send fields <0 >, <1 >, <7 >, <19>, <20> to V.A.T. file
Then send fields <10>, <11>, <12>, <13> to Nominal ledger.

Available at present only on SIRUS/IBM PC.

ORIC & B.B.C. OWNERS- UNLEASH REAL COMPUTING POWER WITH I.T.L. KATHMILL

BYTE DRIVE 500

first Disc Drive with Hybrid Interface Cable and Master D.O.S.

For too long, the performance potential of your computer, has been limited by the lack of a suitable Disc Drive. Now I.T.L's Byte Drive 500 meets this need.

With its 500K Bytes (440K Bytes formatted) capacity, and access time of only 3ms, Byte Drive 500 opens up a new era of computing capability for the more ambitious user.

Byte Drive 500 is compact, economically priced and easy to operate. Systems will shortly be available to interface with Dragon, Spectrum and Vic computers.

The full D.O.S. included in the price consists of:

- 3" F.D.D. Unit
- ✳ Power supply unit & mains cable
- ✳ A single P.S.U. can power 2 drives.
- Hybrid interface cable
- Power unit cable
- Master D.O.S. disc
- 100 page manual

RECOMMENDED RETAIL PRICE £260.00 + V.A.T.

Byte Drive 500 is available from most quality computer retailers. In case of difficulty contact:
I.T.L. KATHMILL LTD.
The Old Courthouse, New Road, Chatham, Kent ME4 4QJ.

Strengthen your hand with Superbase 64

The complete information control system for the Commodore 64.

The World Famous Commodore 64.

No matter what your business or interest, with Superbase 64 you have a totally flexible 'record' system, as big as you want it, as fast as you need it.

Create your own formats, enter your records, change layouts and datafields. Superbase gives you unrivalled control in home or office, business or professional practice, with a range of features including:

YOUR OWN RECORDS
- Design your layout using text, numeric, calculated result, date, linking and key fields
- Record size up to 1100 characters spread over up to 127 items
- Number of records limited **only by your equipment**. As many databases as you want – each with can be thousands up to 15 files
- Learn fast through built-in HELP screens – then add your own notes

FAST ACCESS
- Keyed records for high speed retrieval – 3 secs for any file size
- Select and search for any name, description, number, date, etc. in multiple combinations
- Sort records into any order
- Display selections or generate printed reports
- Browse through records matching on any criteria

TOTAL CONTROL
- Links to other programs and EASY SCRIPT for mailshots, high-quality letters, quotes, tables, etc.
- Effective management of invoices, addresses, stock, membership, appointments – any and every kind of record
- English like commands for easy conversational programming, plus built-in BASIC

DATABASE MANAGEMENT
- Easy to understand menus
- Add or amend fields, or alter length – no file rebuilding needed
- Update files with automatic batch processing option
- Calendar arithmetic for effective time management
- Display quantities, values, totals, as you enter them. Formulas for on-screen result calculation

Britain back in front

Ray Coles on the story behind the Inmos Transputer.

THERE CAN BE little doubt that the establishment of the Inmos high-technology semiconductor operation with large chunks of British taxpayers' money was a risky venture. Too often in the past, such government interference in the market place has resulted in the creation of unstable, inefficient industries which are constantly returning for more cash, without ever delivering the profits which were expected from them.

It is too early yet to state definitely that Inmos will break this mould, but all of its activities to date seem to suggest that it will. Already it has performed wonders for Britain's international image by consistently producing innovative products which have put the country back in the forefront of high technology. I for one have all my fingers and toes crossed in the confident hope that this well organised, highly motivated, ingenious — and, damn it all, British — company can pull it off.

The Inmos operation was boldly planned and cleverly executed by a group of expatriate British engineers and scientists who had been forced to work in the United States to develop their talents as chip designers. Iann Barron, now managing director, led the search for funds with the simple but informed message that there was no reason why the American microchip miracle should not be repeated here. All you had to do was to think big and use the best brains and equipment in the business.

New breed

The marketing strategy was simple too: start with the fastest static RAMs in the world; then move into 64K dynamic RAMs; then set the electronics world on its head with a totally new breed of high-performance microprocessor which would be a revolution in itself. How different to the usual ultra-cautious approach so much favoured by other British semiconductor manufacturers: "Let's wait until someone else has done it, then we will have a dabble. But don't spend too much on it, as we probably won't succeed."

Inmos set up its first manufacturing and design centre in Colorado Springs, in the western U.S. Its first static RAM parts designed there, the 1400 series, went on to become world beaters as predicted. A CAD design centre in Bristol followed, and then a second manufacturing facility in Newport, Gwent. By early 1983 the 64K dynamic-RAM family was in production.

One of the main tasks of the Bristol design centre was to work on the microprocessor, and once again no easy options were taken. Inmos wanted a product that the market would be desperate for: not just another 8086 or 68000 clone, but something new which could offer a quantum leap in processing power so that the world would be breaking down the factory doors to get at it.

The new microprocessor, called the T-424 or Transputer, has now been revealed after months of rumour and speculation. What a machine it is! Designed from the outset to change the way we think about computer architecture, the Transputer is a 32-bit processor with a 4Gbyte address range. It can work by itself or as part of a processor array to deliver astonishing performance.

Inside the 1.15in. square, 84-pin Transputer package there is a single CMOS silicon chip containing the equivalent of 250,000 transistors. They are themselves interconnected to form the main functional blocks including a 32-bit CPU, a 32-bit multiplexed data/address bus, a separate eight-bit peripheral bus, four duplex serial communication links and an array of 4Kbyte of 50 nanosecond static RAM.

Used alone, a single Transputer will be a powerful system in its own right. As part of an array of similar processors, the Transputer provides the basic building block for the design of fifth-generation machines which will be able to execute over 10^9 instructions per second.

If there is one word which best describes the Transputer approach, it has to be "concurrency". On the chip itself, the memory interface bus, the peripheral interface bus and the four serial buses all act independently and at high speed. Put an array of Transputers together and each chip can operate alone, communicating with its fellows over the serial links to receive instructions or operands and to transmit intermediate results. With four serial channels available, any one chip in an array can send or receive data in the up, down, left and right directions all at the same time.

Programming

The problems of programming such a highly parallel system have also been tackled by Inmos. As usual it has come up with an ingenious solution in the form of the brand-new Occam language. Occam handles concurrency by the definition of "processes", which are independent computation units complete with their own programs and data, and "channels", which provide the mechanism for communication between processes. The same Occam program can be executed either by a single Transputer or by an array of any size. To make things easy, the Transputer architecture and instruction set directly support the Occam methodology.

Keep it simple

Occam was developed by Inmos in conjunction with Professor C A R Hoare, director of the Programming Research Group at Oxford University. One of Hoare's academic predecessors was the 14th-century philosopher, William of Occam, who first formalised the concept now known as Occam's Razor. Translated from the Latin it states: Entities should not be multiplied beyond necessity — or in other words, keep it simple.

The Occam programming system is already on sale for use on a variety of other machines, including the Apple II and the ACT Sirius, but the real power of the language will not be fully utilised until the first Transputers start to roll off the Inmos production line in late 1984. The basic Transputer instruction set is very simple, with less than 70 instructions. Some of them execute in a single minor cycle of just 50 nanoseconds; others, such as division, take up to 2 microseconds. The on-chip RAM array can be used for data or instructions and gives the great advantage of short access times. Memory accessed outside the chip itself will be slower because of the need to buffer the interconnections to conventional TTL levels. Up to 10,000,000 instructions per second can be achieved by a Transputer operating from internal memory. Following the T-424 32-bit Transputer will be the T-222 16-bit device with the same instrucion set, and after that the G-213 graphics processor and the M-212 disc controller.

Personally, I would like a few shares in Inmos. I wish the company every success with its current quest for extra funding. It deserves to succeed, and so do we.

THE RAINBOW 10

0+ HAS ARRIVED

In the deluge of computers, at last there's a ray of light.

The Rainbow 100+ personal computer. The latest addition to the Rainbow range from Digital.

It allows you to cope with increasing business demands by having a more powerful memory. (Up to 896Kb for the technically minded.)

It lets you change programmes from CP/M to MS DOS by simply pressing a key. (When using the integral 10MB Winchester Disk drive.)

A choice of monitors is available. High resolution monochromes or colour, for graphics and text.

Lotus 1-2-3 has been added to the leading range of software that already covers most types of businesses.

Two days at one of our 25 personal computer training courses are included in the price of £4,200.

As are full customer support, and twelve month on-site servicing warranty.

And of course our telephone help line.

Call our Customer Information Centre on 02565 9299 for more about the new Rainbow 100+.

Think of it as the pot of gold.

1-2-3 is a Trade Mark of Lotus Development Corporation.

● Circle No. 123

YOU HAVEN'T SEEN ANYTHING LIKE THIS ON A COLOUR MONITOR BEFORE.

An RGB monitor from JVC offering a resolution of 370 x 470 pixels for less than £150?

We guarantee you won't see another bargain like that in this or any other micro mag – or in any other supplier's showroom.

For we've managed to acquire the sole distribution rights to these superb machines and we are able to offer them at an unbeatable price.

There are two models available: medium resolution (370 x 470 pixels) at £149.95; and high resolution (580 x 470 pixels) at £229.95. (Both excluding VAT.)

The units have a 14" screen and are suitable for the BBC Micro, Lynx, Oric, Apple, and most other leading micros.

They are robustly constructed in a handsome cream casing. And come with a full year's guarantee.

Delivery is good: your monitor should arrive by courier service within ten days of our receiving your order.

You can order by filling in the coupon below and posting to: Opus Supplies Ltd., 158 Camberwell Road, London SE5 0EE. Or by telephoning 01-701 8668 quoting your credit card number. Or, of course, you can buy in person at our showroom between 9am-6pm Monday-Friday, 9am-1.30pm Saturday.

Why should you be the one who finds out whether a floppy disk works or not?

With their ability to store everything from a production line's stock control to a complete filing cabinet of records, floppy disks can hurl a company into the computer age. Or set it back years.

Because abrasive coatings on a disk can cause all your precious information to be lost forever.

Ever mindful of the catastrophes caused by data loss, 3M make floppy disks that are at least 32 percent less abrasive than the industry average.

They can exceed 10 million passes (equivalent to changing data every hour for centuries) as opposed to the mere 3½ million expected by disk drive manufacturers.

YOU HAVEN'T SEEN ANYTHING LIKE THIS ON A COLOUR MONITOR BEFORE.

An RGB monitor from JVC offering a resolution of 370 x 470 pixels for less than £150?

We guarantee you won't see another bargain like that in this or any other micro mag – or in any other supplier's showroom.

For we've managed to acquire the sole distribution rights to these superb machines and we are able to offer them at an unbeatable price.

There are two models available: medium resolution (370 x 470 pixels) at £149.95; and high resolution (580 x 470 pixels) at £229.95. (Both excluding VAT.)

The units have a 14" screen and are suitable for the BBC Micro, Lynx, Oric, Apple, and most other leading micros.

They are robustly constructed in a handsome cream casing. And come with a full year's guarantee.

Delivery is good: your monitor should arrive by courier service within ten days of our receiving your order.

You can order by filling in the coupon below and posting to: Opus Supplies Ltd., 158 Camberwell Road, London SE5 0EE. Or by telephoning 01-701 8668 quoting your credit card number. Or, of course, you can buy in person at our showroom between 9am-6pm Monday-Friday, 9am-1.30pm Saturday.

OVER 20,000 PEOPLE CAN'T BE WRONG

ACT SIRIUS 1

£2,195

Powerful 1.2Mb data storage with 128K RAM and including two of the industry standard operating systems at 16-bit level, CP/M-86 and MS-DOS. PLUS Basic 86.

£2,895

2.4Mb data storage with a big 256K RAM for the really demanding business applications. Includes CP/M-86, MS-DOS and Basic 86.

Above are two very good reasons why more people have bought the ACT Sirius 1 than any other 16-bit microcomputer in the U.K. Here are a few more:

ACT Sirius 1 is a superb user-friendly machine incorporating a comprehensive 'soft' keyboard, a 12" high resolution screen for crisp, clear definition and a wide range of memory options including a 10Mbyte Winchester version and a choice of three plug-in expansion boards.

The range of available software is simply unrivalled in the personal computer field. Over 1,000 software packages now exist to provide complete solutions to the needs of large and small businesses alike.

And of course the ACT Sirius 1 is backed by the strength and resources of ACT. The Pulsar range of true 16-bit software for accounting, planning and word processing; ACT Training Centres open to all; nationwide field service; a full range of printers and consumables. And, the most complete and professional dealer network in the U.K.

Over 20,000 people are rightly convinced that the ACT Sirius 1 is the best machine of its kind in the country.

CAN YOU REALLY AFFORD TO BE WRONG?

ACT SIRIUS 1, THE UK'S BEST SELLING 16-BIT MICROCOMPUTER.

Please send me details of the ACT Sirius 1.

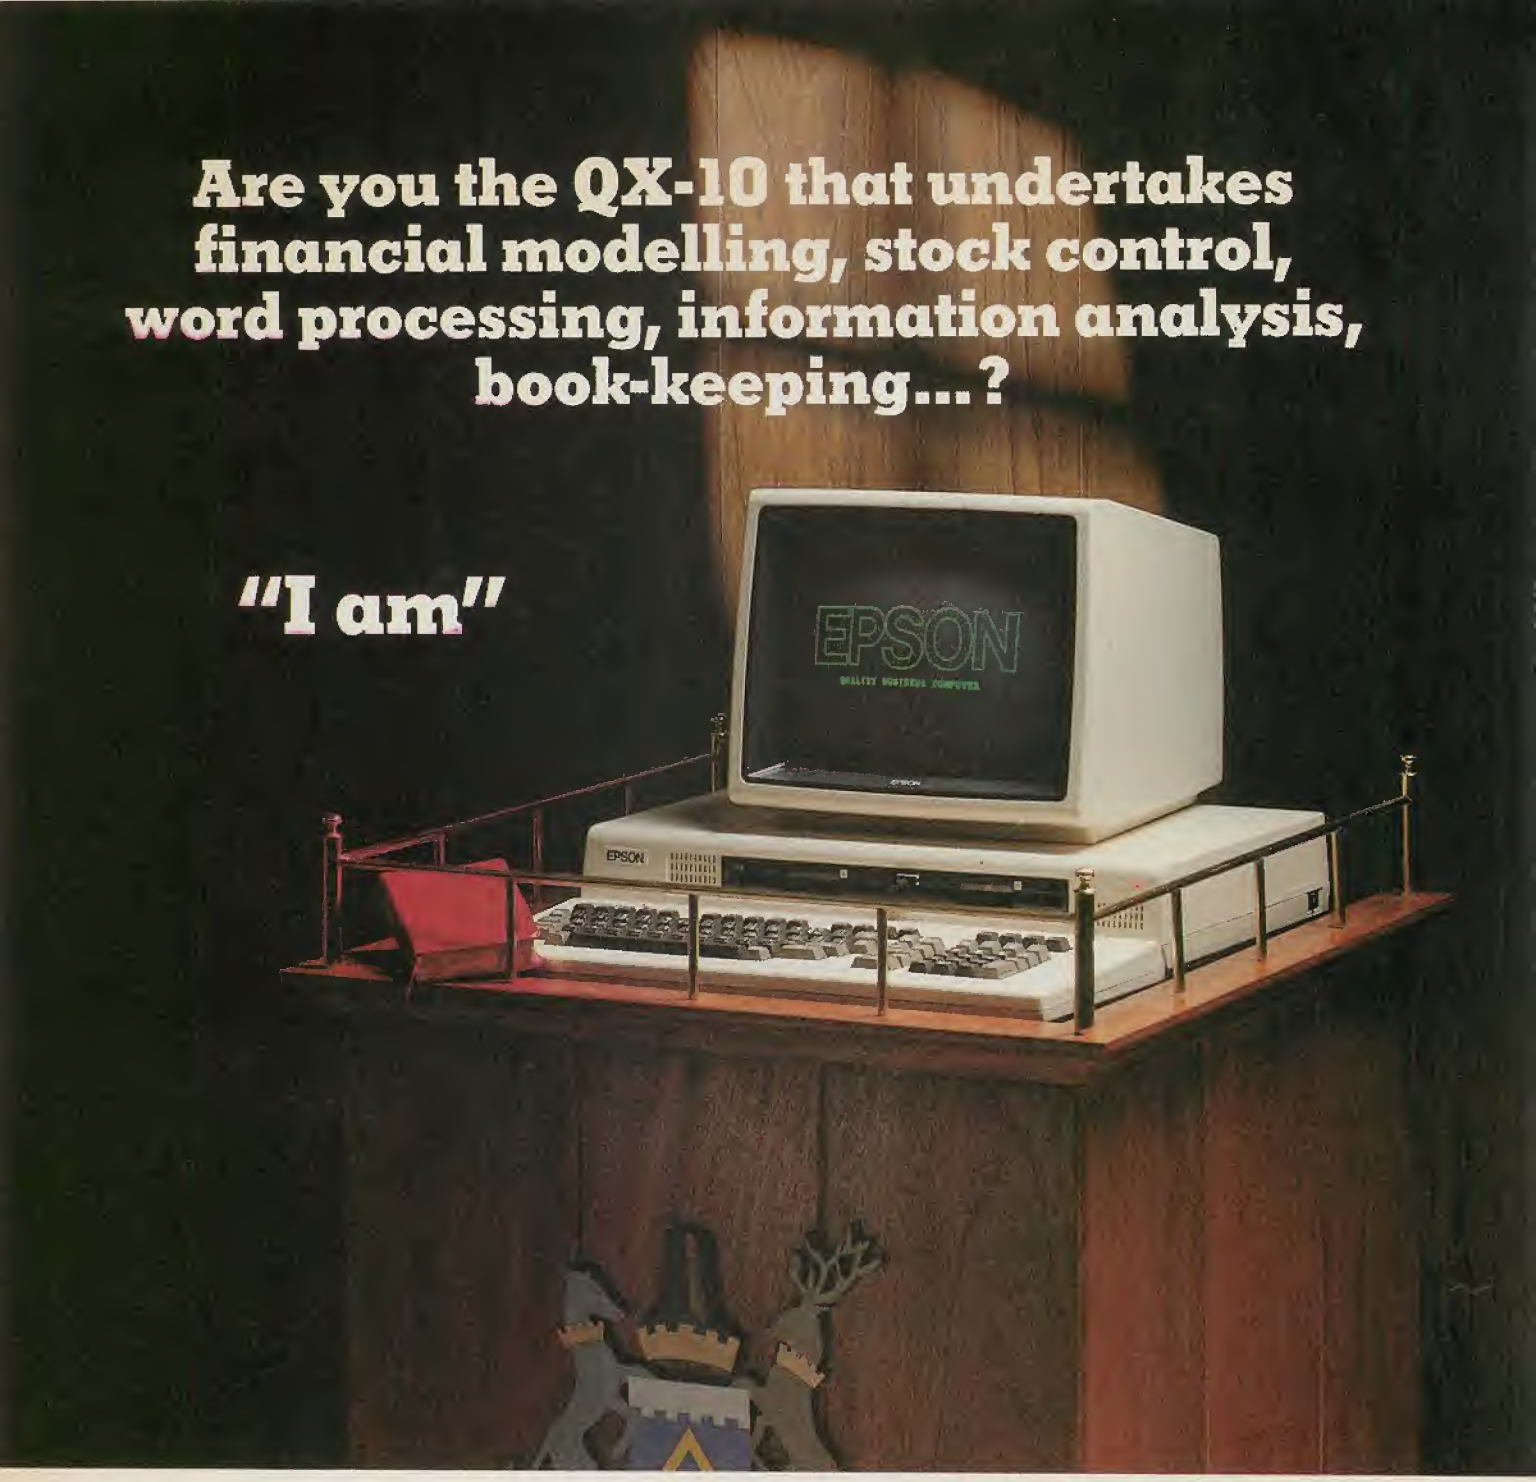
Are you the QX-10 that undertakes financial modelling, stock control, word processing, information analysis, book-keeping...?



With over 20 years of experience in producing high quality printers, Epson have now perfected a fully integrated desktop computer. All the evidence has gone to prove that the QX-10 is capable of performing all the tasks you will ever require of it, quickly and efficiently.

Installation of the QX-10 can be carried out with the minimum of interruption, and with its easily understandable keyboard, it is simplicity itself to operate.

Having such a diverse range of software packages available such as database from Pearl and office productivity and accountancy from Peachtree with C P/M and multifont BASIC as standard, the QX-10 can supply all the answers whatever your business.

Just look at what's on offer: a big memory – 192k upgradable to 256k RAM and all the graphics you'll ever need – and high resolution graphics at that.

The ability to communicate easily with other machines, including our own HX-20 and the advantage of using our fine range of printers, make the QX-10 a totally versatile system at a price you'll find impossible to equal – £1735 plus VAT.

If you're looking at micros, look at the QX-10.

The system with all the answers.

● Circle No. 128

PC XT/370

THE XT/370 mainframe-on-a-desk version of the IBM PC — see the report in our January issue, page 29 — has been announced by IBM U.K. It offers three modes of operation. First, it is a standard XT Personal Computer with 10Mbyte of hard-disc storage. Second, it emulates an IBM 3277 Model 2 display terminal connected to a mainframe. Third, it runs under the new Virtual Machine/Personal Computer operating system, which enables it to run many programs for the IBM mainframe Virtual Machine/Conversational Monitor System on a desk-top computer.

The XT/370 carries three extra cards which carry a standard Motorola 68000 chip, and two customised IBM chips — one based on the 68000, another on the Intel 8087. The second card carries 512K of extra RAM. The third provides the coaxial communications which are needed for terminal operation.

The XT/370 will be manufactured in Greenock, Scotland, for a September 1984 launch in the U.K. The price is a mere £8,228 plus VAT, plus £919 for a VM/PC software licence. When the IBM 370 mainframe was current it usually cost around £1 million.

Contact IBM United Kingdom Ltd, PO Box 41, North Harbour, Baltic House, Portsmouth PO6 3AU.

IBMulators

MORE computer manufacturers are following the fashion of offering IBM compatibility. Among the latest are ITT, Televideo and Olivetti.

ITT will be launching the Xtra, with an Intel 8088 CPU, 128K of RAM, a 10Mbyte hard disc and one floppy — an IBM PC XT look-alike. Televideo's 1605 will be an IBM PC compatible micro, and is expected to be launched in the U.S. early in 1984.

Olivetti will be making its own version of the Corona PC look-alike for sale outside the U.S. Like Texas Instruments with the Professional, and Tandy with the Model 2000, Olivetti now appreciates that it has no choice but to offer IBM PC emulation. The long-term future of the Z-8000 based M-20 is presumably unaffected, as Olivetti has an 8086 card for it.

Columbia PC relaunch

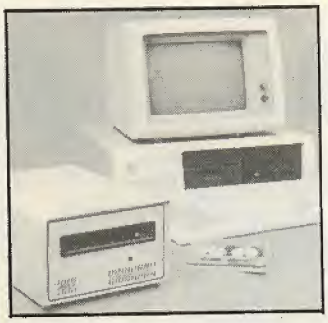
THIS WELL KNOWN IBMulator has been relaunched in the U.K. by Icarus. Its Compaq standard of IBM compatibility has made it the leading look-alike on the U.K. market in the continued absence of the Compaq transportable.

The major change is that it is now supplied with an amber monitor, which is preferred in many European countries. Other new features are the free suite of Perfect software and a graphics package, in all worth £750, plus a little heart logo on the front which features in the new advertising campaign.

Contact Icarus Computer Systems, Deane House, 27 Greewood Place, London NW5 1NN. Telephone: 01-485 5574.

PC back-up

ALLOY has introduced a nine-track magnetic tape sub-system for the IBM PC. The ITS-PC offers 42Mbyte of back-up storage or, more interestingly, allows data to be interchanged



between a PC and a mainframe. For this you also need Alloy's PC-Tip tape-interchange program.

Alloy's other products are PC-Stor, which is a hard disc with built-in tape cartridge for back-up, and PC-Backup, which is a separate tape cartridge for backing up your PC XT.

Contact Alloy at Cotteswold House, Gloucester Street, Cirencester, Gloucestershire GL2 2DQ. Telephone: (0285) 68709.

Perex is also now supplying a tape back-up system for the XT, called the Peridata 4510/IBM. Contact Perex at Arkwright Road, Reading, Berkshire RG2 0EA. Telephone: (0734) 751054.

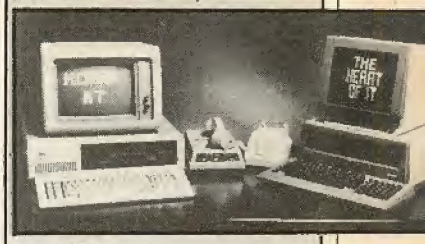
Fun and games

THE IBM PC is already starting to monopolise the professional/executive software scene with products like Lotus 1-2-3, Multimate, Oz and Expert-Ease. But now about 40 percent of America's best-selling games, as listed by Softsel, already run on the IBM PC. For comparison, over 80 percent run on the Atari micros, over 70 percent on the Apple, while about 60 percent run on the Commodore 64.

The top 20 includes 10 games that run on the IBM PC, including Zork I, II and III, Frogger, Temple of Apshai, Deadline, Planetfall, Miner 2049er, Enchanter, Serpentine and Witness, plus the famous Microsoft Flight Simulator.

With up to 1,000,000 PCjrs to be sold in 1984, the current flood of IBM games will become a torrent. This is particularly good news for a small British company whoose Advance computer is currently being manufactured by Ferranti, and which promises to provide IBM PC compatibility for only £400 — see our October 1983 issue.

Software shorts



● **ACT** has announced its Micromail package, reviewed in the November issue of *Practical Computing*, as Micromail Blue for the IBM PC. Telephone: 021-454 8585.

● **Prospero Software** has a new Pascal compiler for the 8086 family of chips. See our June 1983 issue for a review of Pro Pascal on eight bits, as the 16-bit version is said to be fully compatible. Telephone: 01-785 6848.

● **Sky Software** is not a new company, just a new name for what was Comsoft. Its new range of Blue Sky packages are Skymaster, Skymail, Skycost and Skybuild. They run under the Skymos multi-user operating system on IBM PCs linked using PC-Net. Telephone: (0527) 36299.

● **Inner Loop** software of Los Angeles has launched Scrollmate, which provides up and down scrolling of up to 14 screenfuls of text under MS-DOS. Telephone: (Area code 213) 822-2800.

● **Graphic Communications** of Massachusetts has produced a suite of 24 programs to simplify the design of presentation graphics on the IBM PC and XT. Pete & Pam is importing it. Telephone: 01-677 7631.

● **GCS Communications** has extended its range of products to include P-Cox, a 3270 coaxial interface for the PC and its look-alikes. It costs £900. Telephone: 01-898 2121.

● **Sophco** of Boulder, Colorado, has introduced Protec, a $250 master-menu and security-control program for the PC and XT. It not only shuts out unauthorised users but prevents passing humourists from typing commands like Format C: on the XT. Telephone: (Area Code 303) 444-1542.

IBM PCjr

Jack Schofield takes a hard look at the spec of the "Peanut" and assesses how it will fare against the established home-micro competition.

AFTER INTENSE industry speculation, IBM finally launched the "Peanut" microcomputer — now called the Junior or PCjr — in the U.S. on November 1 last year. One month later some 1,000 machines were delivered to dealers for demonstration purposes. Sales were not scheduled to begin until January — after the Christmas rush on which so many micro companies have come to depend.

The timing of the announcement was presumably to encourage those considering a micro to wait until after Christmas, instead of buying another model in December. The only two surprises were the name, and the infra-red keyboard connection.

Whether you like the name or not, it is accurate, although some Americans are already calling it the "Pee Wee", to distinguish it from the "Pee Cee". The infra-red keyboard connection is a logical part of the design. The deskless home user wants to relax in an armchair, not be cabled to the system box.

The thinking behind the PCjr is interesting. IBM's problems with the PC are twofold. First, it is too successful; second, it is too expensive for Everyman, even in America. Most home buyers of the PC and XT — and there are many — have some business justification for their purchase. People who don't generally cannot afford it. Schools, colleges and even some corporations have also found the price of the PC a disincentive: just think about the cost of buying them by the thousand.

Of course, IBM could not solve the second problem by reducing the price of the PC again. That would merely exacerbate the first problem. It can already sell PCs and XTs faster than it can make them. And, of course, reducing the price of the PC would mean smaller profits.

The PC is over-specified for the home/school market, and the PCjr offered the chance to make a more suitable machine. The easy way would have been to make the new machine largely incompatible with the previous models, like Commodore with the Vic-20. However, this did not mesh with IBM's overall strategy of taking over the entire microcomputer industry with a string of PC products from the top to the bottom of the range.

It was far better, both for IBM and for the user, to make the jr, as far as possible, a PC-compatible machine. The problem then was that while the PCjr had to be good enough to take advantage of the huge software market created by the PC itself, it also had to be not too good, or it would take sales from the more profitable elder brother.

IBM's solution was to retain the Intel 8088 CPU, the PC-DOS operating system and disc format, and fundamentally the same Microsoft Basic, so as to largely retain software compatibility. This enables the PCjr to be offered in large volumes by IBM's corporate sales force, either for use as a cheap work station or for executives to use at home.

To make the system more suitable for the home/education market, IBM added colour graphics as standard, cartridge slots, joystick ports, and expanded the PC's single-tone sound to three channels. These decisions offer an interesting contrast with

Acorn, which deliberately offers less rather than more in all these areas in order to make the Electron a conspicuously inferior machine compared to the BBC Micro.

IBM has ensured that the Junior's weaknesses are in areas where the home/school user does not suffer too much, but where the business buyer is affected. So it has an inferior keyboard and, for now at least, only one disc drive. The PCjr does not have the same internal expansion system as the PC, so business users will not be able to add large quantities of RAM, clock/calendar cards, etc. And while the text display is good, it is not of the exceptionally high quality of the IBM PC.

Not crippled

However, as the keyboard is detached from the main unit, no doubt third parties will offer replacement keyboards and add-on disc drives sooner rather than later, and internal expansion is possible. So though the PCjr may have had one hand tied behind its back, unlike the Electron it has not been deliberately crippled.

The 62-key cordless keyboard is powered by four AA batteries, and weighs 25 ounces. It communicates by infra-red signals with the main unit at distances of up to 20 feet, as long as it is within view. An optional 6ft. adaptor cord is required if more than one PCjr is to be used in the same room.

As the PCjr keyboard has 21 fewer keys than the PC model, something has had to give. For a start, the 10 dedicated function keys are missing, though as on the Electron the functions can still be used by pressing the function key and the number keys. The separate numeric keypad has gone too, though there are now four cursor control keys arranged in a neat cross. The spurious Backslash key — sited between the left Shift key and Z on the PC — has also disappeared, just when we were learning to accept it as the new standard and Elan had carefully added it to its new micro.

For software compatibility, the PCjr keyboard can produce all the codes produced by the standard PC model, though in some cases the key combinations required are less convenient. Still, that is not too bad a limitation. The keyboard has two other distinguishing features: rubber key caps and no labels, as the key labelling is on the keyboard itself. The layout can be customised by reprogramming any of the keys and adding a keyboard overlay.

The rubberised key caps are squishy but apparently not hard to type on for limited periods. In this respect the keyboard is the worst part of the PCjr. It is regrettable that what will be, when it arrives, one of the most expensive home/education micros on the market should have a keyboard that is inferior to cheaper rivals.

The PCjr comes in two models: an entry-level system, and a full-specification model with a built-in disc drive. The system box measures about 14in. long by 11in. deep by 4in. high. Both models have the same detached keyboard, separate power transformer, a *Guide to Operations* manual and *Hands-On Basic* booklet.

The system box has two cartridge slots on the front, plus ports for a cassette recorder, two joysticks, external amplifier and speaker, a keyboard cable, a light-pen and various video displays. There is one spare socket. Unfortunately these ports all seem to be non-standard designs. IBM evidently expects people to pay outrageous prices like $30 for a TV-set connector or cassette-tape adaptor cable. Some schools and corporations will probably shell out, but enthusiasts will rapidly find cheaper alternatives.

Both models have 64K of ROM. It includes self-test diagnostics, as do the Atari XL micros, and a program called Keyboard Adventure which uses graphics and sound to introduce the keyboard. The entry-level model has 64K of RAM and produces a standard 40-column display on a TV set, composite video or RGB colour monitor. In addition to 320-by-200 pixel resolution in four colours, and 640-by-200 pixels in two colours — both of which are offered by the standard IBM PC with colour-graphics card — the entry-level PCjr also offers a 16-colour mode with 160-by-200 pixel resolution.

The other PCjr has 128K or RAM, with no room for more inside, and a 360K half-height 5.25in. floppy-disc drive that uses the same PC-DOS operating system and format as the standard PC. It has better graphics too, and can display 80 characters per line.

OS costs extra

The enhanced model comes with two discs. The first, Exploring the PCjr, is a tutorial which includes system use and simple programming. Your IBM PCjr contains sample programs for home use including a word processor, address file, etc. This model costs $1,269, but you need to spend $65 more for the PC-DOS 2.1 operating system.

There is another catch. With both models the sound, graphics and some peripherals are fully supported only by a plug-in cartridge Basic, for which IBM charges an extra $75. It is tempting to complain about charging extra for a Basic language cartridge, and it did not win Atari friends for the 400. However, the Commodore 64 has proved successful in spite of the fact that the hardware is virtually unsupported by the Basic. At least IBM will probably supply a useful extended Basic, a feat which seems to be beyond Commodore.

The entry-level PCjr can be upgraded by adding a disc drive and a 64K expansion, mainly used for colour graphics. With the PC, video RAM is held on a separate card, but with both models of the PCjr it comes out of main memory. Both models can be upgraded by adding a modem — in the U.S. at least — and serial or parallel printer connections.

The PCjr Basic cartridge is a superset of the original Microsoft Basic. It supports the enhanced graphics and sound capabilities, the light-pens, the three-voice sound and asynchronous communications. As such it is more a necessity than an option.

The IBM PC Compact Printer is a 50cps thermal unit which uses single-sheet, fanfold or rolls of thermal paper. It costs $175. The IBM PC Color Printer prints in up to eight colours. It offers 200cps in draft mode, 110cps in correspondence mode, and 35cps in letter-quality mode. It can use single-sheet, fanfold and rolls of paper up to almost 15in. wide and costs $1,995. Both

(continued on next page)

The PCjr is a downgraded model, and there are 21 fewer keys than on the PC.

(continued from previous page)

printers can be used with all versions of the PC, right up to the XT/370 "desk-top mainframe".

Three groups of programs were launched with the PCjr. There are two new programs intended for all models of the PC. The first of these, the Personal Communications Manager, provides access to other computers via the telephone lines and thus to Dow Jones and The Source, in the U.S. The second is the Fixed Disk Organiser program — not much use with the PCjr.

The second group comprises updated versions of seven programs for all models of the PC. They are Casino Games, Strategy Games, EasyWriter PFS:File, PFS:Report, Basic Program Development System and Time Manager. In all some 30 of the programs in IBM's own PC line-up are said to run on the enhanced PCjr.

The third group comprises new IBM-badge cartridges and disc-based programs for home and educational use. They include Homeword, Home Budget Jr and Turtle Power. Homeword is a simple picture-based word processor from the Apple/Atari software house Sierra On-line. Home Budget Jr is from the Software Publishing Corporation. Turtle Power is a turtle-graphics program from The Learning Company, though IBM already has a Logo. Games on cartridge include Mouser, Mineshaft and Crossfire.

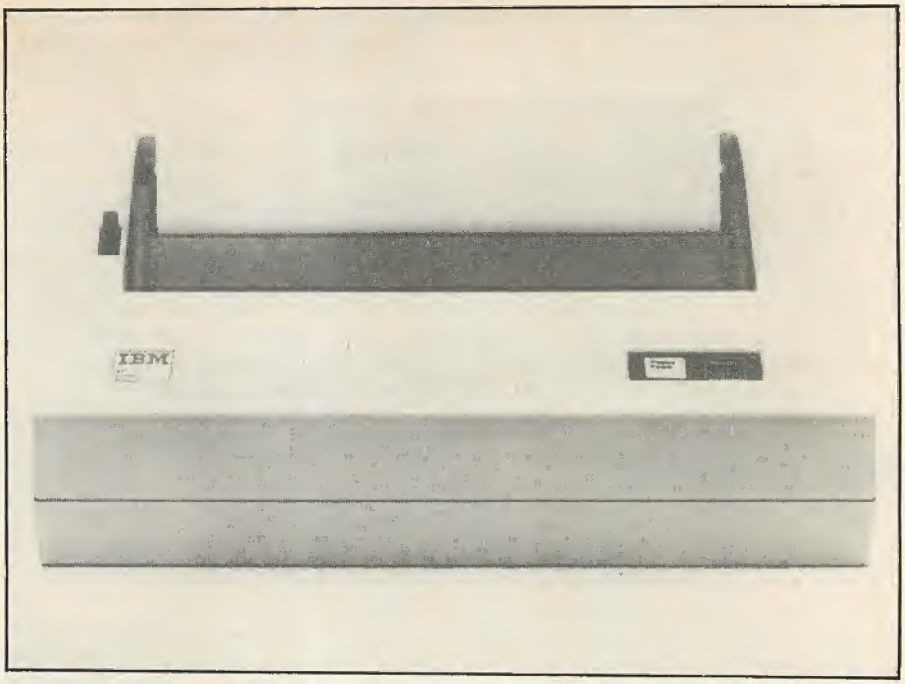
Software flood

Given the vast number of software houses producing programs for the IBM PC, other third-party software will undoubtedly flood the market. There is already a PCjr magazine.

The entry-level system looks a bad buy. In the sound and graphics departments it offers no advance over the Atari 800XL while it is more than twice the price. The keyboard seems grossly inferior, and the entry-level PCjr is at a major disadvantage when it comes to software. The Atari has hundreds of good programs available, while initially this model of the PCjr has only a handful. After the unveiling of the PCjr, Atari announced a price increase — from after Christmas — on its range.

The Commodore 64 has similarly little to fear from the entry-level PCjr. The Commodore is a bit of a seven-stone weakling in terms of its pathetic Basic and cassette-tape software — are there more than three good games? Nonetheless the Commodore 64 hardware looks much more powerful. A PCjr plus Basic costs more than a Commodore 64 plus disc drive: all-in-all the Commodore is a far better buy.

The enhanced PCjr is a different basket of chips. While the price is still not going to worry Commodore, or Atari's 1450XL model with built-in disc drive, it should certainly worry Apple. With 128K of RAM, an 80-column screen and PC-DOS 2.1 the PCjr can rival any small micro on the market thanks to being able to share



software with the IBM PC. The Basic, graphics and sound are all superior to the Apple IIe, and the PCjr price is very competitive.

At its launch, the Apple IIe without disc drive had a list price of $1,400 — just twice as much as the entry-level PCjr, and more than even the disc-based model. While the Apple II still has more software, and more good software, than any other micro, the PC is catching up fast. The PCjr could well tip the balance.

Further, the PCjr offers an upgrade path, which the Apple IIe conspicuously fails to do. The PCjr is simply the bottom rung of a ladder through which the user can progress via the IBM PC and XT right up to the XT/370. Not many individuals will go all the way, but the facility certainly matters to schools, colleges and corporations.

However, a glance at the sparsely-populated Apple IIe board suggests Apple can slash the American price to make it competitive and still make a comfortable profit. In the U.K. the situation is more uncertain. Here the competition is not Apple but the superior Acorn BBC Micro. Apple has basically ignored the home-into-business market well represented among readers of this magazine — just try looking for Apple advertisements in *PC*! — and has left the BBC Micro to capture tens of thousands of sales unopposed.

The BBC Micro has massive support from serious home/educational/small-business users. It also probably has a year's grace before the PCjr finally arrives. By this time the BBC software base will be that much stronger, especially in the area of small-business and executive tools where it is currently weakest. It should continue to prosper, possibly at the same price as today, though with a profit margin for dealers. Apple may be squeezed between the BBC and the PCjr, and the IIe's price might well need to drop to under £500.

Whenever the PCjr arrives, and whatever the price, it looks likely to establish PC compatibility as a major factor at the bottom end of the micro market. This will benefit the Advance and other IBM look-alikes due to appear on the home-micro market. Machines which have a strong user base or can develop one before that happens should be OK. Trying to establish a new standard, like the Japanese manufacturers with the Microsoft MSX eight-bit system, looks like a complete waste of time.

Conclusions

● The main advantage of the PCjr is that it offers compatibility with the IBM PC, and thus both a share of the software base and an upgrade path.

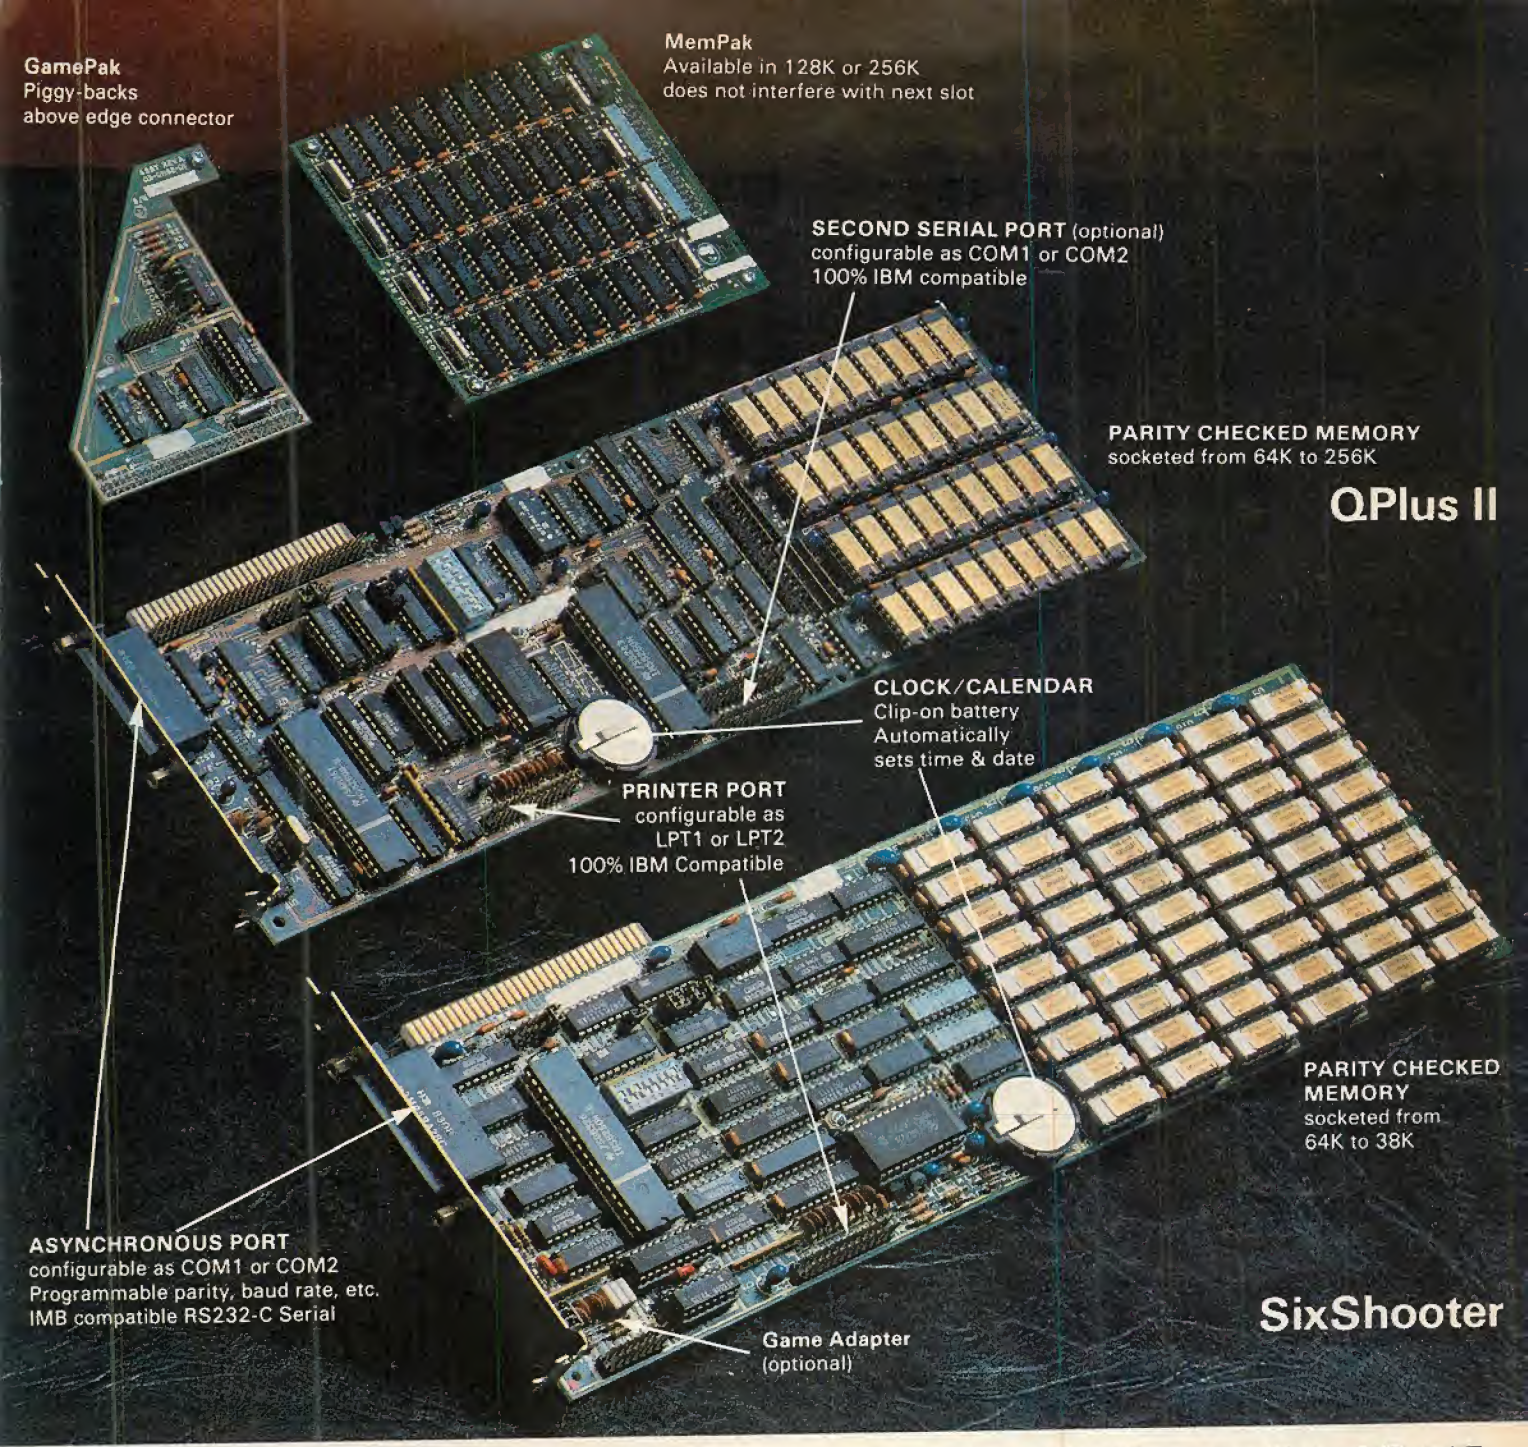
● The main disadvantage is the keyboard. It looks as though its deficiencies are deliberate, in order to protect sales of the IBM PC itself.

● A further disadvantage is that it has non-standard ports and the nominal price does not include numerous extras that will in fact be required — like DOS 2.1 with the enhanced PCjr. The new models are more expensive than they look — but then, this applies to many other machines too.

● The PCjr entry-level system is under-powered and overpriced at $669 plus extras. If it comes to the U.K. at £500 to £550 it should not hurt the BBC Model B, though it might.

● The enhanced PCjr is very competitive at $1,269 including disc drive. If it arrives in the U.K. at around £1,000 it looks likely to hurt Apple.

● The PCjr will be a success thanks to the excellence of IBM's marketing and the strength of the name. PC compatibility could be established as a major force at the bottom end of the micro market, wiping out those firms who do not have a large user base.



THE ONLY BOARDS YOU REALLY NEED FOR YOUR IBM PC OR XT

QPlus II and the **SixShooter** are America's most popular pair of enhancements for the IBM PC & XT. They offer the most comprehensive list of features available while occupying just one slot in your computer. State of the art engineering along with the most rigorous quality controls in the industry result in a product in keeping with the high standards set by IBM.

The **Qplus II** comes standard with clock/calendar, asynchronous serial port (RS232C), and your choice of memory from 64K to 256K. Options include: a second asynchronous port, a parallel printer port, a game port on a plug-in "piggy-back" board, and a choice of 128K or 256K MemPaks. The MemPaks give you the ability to add 384K or 512K of memory in one slot.

The **SixShooter** is ideal for the XT model. It offers a battery powered clock/calendar, asynchronous port, parallel printer port, SuperDrive & SuperSpool software, and your choice of memory up to 384K, all standard. Optional is an IBM compatible game port adapter.

● Circle No. 129

Also included with both boards is the SuperDrive™ disk emulation software. It allows you to create up to three "electronic disk drives" in memory which access your programmes at the speed of RAM memory. You also get SuperSpool™, a programme which allows you to assign a portion of memory to act as a print spooler.

Both boards are backed up by a one year parts and labor warranty and 48 hour turnaround on any warranty repairs. Visit your local dealer and pick up a brochure with the full details. If he doesn't have the information have him give us a call. Your PC will really thank you.

Suggested List Prices:
64K £319 128K £389 192K £459 256K £529
Options: Second async port, printer port, game port, and GamePak, each £40. MemPak 128K £199, MemPak 256K £349.

BRITISH MULTI-USER SYSTEM

Some installations are a little more difficult than others!

Such as the one at Banham Patent Locks, Limited, in London.

BROMCOM® supplied hardware and software that would have taken a respectable-sized minicomputer from, say, DEC or IBM or Olivetti at twice the price for hardware, three times the price for software and four times as long to implement.

The Hardware – BROMCOM SuperStar™ – is handling six terminals (expandable to 16) and three printers with 20Mbyte disk storage and tape backup. The operators work round the clock, so the speed and reliability demanded of the system are high.

Operators can simultaneously enter Invoices, Payments, etc, while other functions such as word processing and database operations (over 15000 entries!) are in constant use by other terminals.

- POWERFUL – HIGH PERFORMANCE – FLEXIBLE
- VERY COST-EFFECTIVE WITH LOW ENTRY PRICE
- FULLY MODULAR AND EASY LOW-COST EXPANSION
- WORLD-STANDARD S100 HARDWARE AND OPERATING SYSTEM – CP/M OR MS-DOS
- FULL MULTI-USER CAPABILITY WITH RECORD/FILE LOCKING AND PRINTER SPOOLING
- FIELD-PROVED OVER TWO YEARS WITH A LONG LIST OF SATISFIED CLIENTS
- STYLISH NEW DESIGNS FOR 1984 AND BEYOND
- MODEL 10 CATERS FOR UP TO 6 USERS, MODEL 20 UP TO 16 USERS

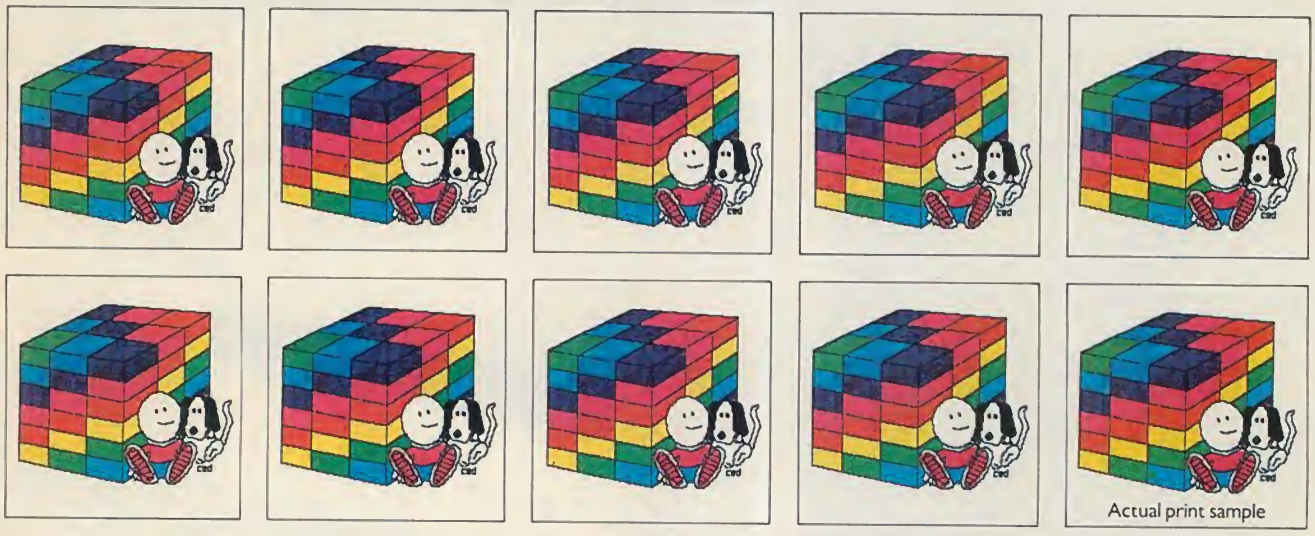
Put some colour into your printing without going into the red



The new PRISM impact matrix printers let you put colour into your printed output, at a cost you can afford. Both the PRISM 80-column and the PRISM-132 column make most single colour printers look pale by comparison.

- ☐ Added versatility: the four basic colours (black, cyan, magenta and yellow) can also be mixed precisely to give up to 144 different shades.
- ☐ Correspondence quality at 110 cps.
- ☐ High quality draft printing at 200 cps.
- ☐ 84 x 84 dpi high resolution graphics capability.
- ☐ Staggered 9-wire print head – ideal for precision word processing applications.
- ☐ Bi-directional printing to maximise throughput.
- ☐ Proven reliability.
- ☐ Selectable automatic justification and character sizes.
- ☐ Optional manual and automatic sheet feeding.

PRISM printers.
They brighten up your day.

- ☐ Compatable interfaces to most micros including Apple, IBM and Sirius.

Dealer Enquiries Welcomed.

CAMEL PRODUCTS

firm up your software with an

EPROM PROGRAMMER AT LAST! for the Spectrum user.

Put your programs, utilities, Assemblers into EPROMS for instant load from the unique ROM-SP

ROM-SP **NEW** **for Spectrum**

Ingenious unit for Spectrum, with 2×28 pin sockets and a Reset button allows up to 16K of Basic or M/C program to RUN or LOAD instantly from EPROMS. Cabled connector and full extender card. NOTE: Does not disable Sinclair ROM. £29.95

PROMER-SP **NEW** **for Spectrum**

A brand new Spectrum programmer for 2764/128. Zero insertion force socket & software on tape. Delivery Jan. 84. Order now at £29.95

PROMER 81-S **NEW** **for Spectrum**

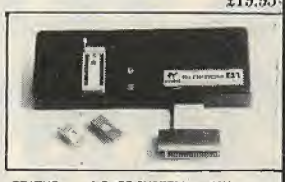
The very popular PROMER-81 for the ZX81 has been adapted to the Spectrum and the price kept low. £22.95

ROM-81

Provides two 24 pin sockets for up to 8K of EPROM memory in the 8-16K area. Can use 2516/32 or 2716/32 £14.95

PROMER-81

At last! A low cost reliable programmer for 2516/32, 2716/32 EPROMS. This is the solution to using EPROMs instead of tape. Requires 4×PP3 batteries for a regulated 25 volts. Remarkably priced at £19.95



BLOPROM-81

A uniquely sophisticated EPROM PROGRAMMER

In use at various labs incl. Sinclair Research

Eprom programmer for the 2516, 27XX single supply families, yes, even the 27128 from Intel. Check, Read, Program + Verify all or part of Eprom.

So immensely user friendly you'll hardly need the manual. Designed for the beginner but includes a single key entry route for the professional. Supplied as firmware, the m/c driver routine alone is worth more than the price of BLOPROM-81. No Personality Cards, or other additions, just a ZX81. Several inbuilt safety features. On-board Vpp generation. 28pin ZIF socket. Cabled connector and extender plug. ABS case.

● Circle No. 138

● Circle No. 139

Microware and IBM — an unbeatable combination.

We promise to:

- Analyse and identify your requirements.
- Advise on your system needs.
- Supply and install your equipment.
- Provide the widest range of software support.
- Offer comprehensive maintenance contracts.
- Take pride in our unparalleled after sales service.

MEMORY EXPANSION

1. Memory expansion from 64-512K
2. Memory expansion with extended features:
   - Printer port
   - R232
   - Games control
   - Battery clock/calendar
   - Expansion up to 512K
3. Memory expansion for electronic disk (RAM) providing capacity of up to *2 Mb*

MULTI-TASKING

- Multi-tasking software is now available for PC DOS – up to 9 tasks can be run
- Concurrent CPM

WINCHESTER DRIVES

1. PC Pair
   Hard disk storage
   - 3.9" Winchester drives
   - Single board DTC controller plugs directly on to PC Bus
   - No additional power required
   - Fixed or removable second drive
2. Our range of 5¼" external Winchesters provides up to *80 Mb* of storage
   - Easy back up facility

NETWORKING

PC net

- Local area network and shared resource
- Independent of disk type ie XT, corvus etc
- Independent hard disk system
- Remote PC
- IBM PC DOS 1.1, 2.0
- Disk and file sharing
- Low cost, easy to use
- Simple to set up
- Up to 16 PC's per file sharer

SOFTWARE

Pegasus - Business application systems

- Sales Ledger
- Purchase Ledger
- Nominal Ledger
- Invoicing
- Payroll
- Stock Control
- Order Entry
- D Base II Applications

Our complete list of software is too long to publish, but the widest range is available from stock including:
Wordstar, Mailmerge, Supercalc, D Base II, Fortran 80, Easyfiler, Easywriter, Visicalc

TRAINING

We offer training to our IBM PC customers:

1. Computer aided training, which, after initial set-up, your PC guides you through the software
2. On site personal training by our experienced professional instructors

MONITORS

We recommend from our range the following:

- The new IBM colour monitor
- LUXOR – high res. colour
- AMDEK – the only IBM compatible amber screen monochrome available
- HANTAREX – 14" high res. colour

SERVICE

We offer a number of service options including:

1. Warranty/non-Warranty repairs
2. Extended Warranty contracts
3. Quick response service contracts covering both parts and labour

PURCHASE TERMS

1. Rental agreements
2. Leasing contracts
3. Approved credit purchase
4. Credit cards

A PERFORMANCE AND PRICE BREAKTHROUGH IN APPLE][® & //e HARD DISC STORAGE

High Performance AID hard disc systems of 5-20 megabyte capacities, specifically designed for use with the Apple, are now available running under DOS, CP/M & Pascal. The units cold boot and throughput speeds are really impressive. If you want to leave others standing, try our fast DOS option!

The range features the 5+5 and 10+10 drives which enable you to configure half the drive as primary and half as secondary storage for ease of archiving.

The systems have been designed around the concepts of data reliability and convenience of operation.

They are simply the most competitive hard discs on the market. So why pay more for less.

PULSAR BUSINESS SOFTWARE The star performer for apricot

The Pulsar range of business software will turn Apricot into a powerful management tool.

Software engineers working hand-in-hand with the Apricot development team have enhanced the range of accounting, word-processing and modelling packages to maximise Apricot's exciting fourth generation features.

Already 10,000 users of Sirius and IBM PCs have given Pulsar their seal of approval.

STAR PERFORMER

PULSAR takes the mystique out of computing without sacrificing performance. From the design of the software through to the documentation, the accent is on friendliness and ease of use, making it an effective business partner in a matter of hours.

And by harnessing the new fourth generation features of Apricot – like the unique MicroScreen™ – Pulsar has become the friendliest business software around.

Pulsar is true 16-bit software developed by ACT at a cost of over £1 million for today's business computers. Pulsar owes nothing to early 8-bit software, being developed from powerful programs written by ACT's engineers for its own bureau mainframe computers. It draws on over 18 years experience in creating packaged business software.

DESIGNED TO PLAY A LEADING ROLE

The Pulsar range has been designed to meet all the management information needs of business users. Consisting of some 15 integrated packages, the range includes commercial accounting functions, office systems for word processing and electronic mail, and management tools for planning and modelling. The integration between packages is powerful and flexible.

Shared information means files don't have to be duplicated and data does not have to be re-entered.

AND IN SUPPORT

ACT's investment in Pulsar goes beyond the software to encompass full training facilities for users and 'hot-line' support for your dealers to make sure you get the best service possible.

In addition to a nationwide network of over 500 independent dealers ACT has hand-picked 60 Pulsar Software Centres who specialise in Pulsar and can give immediate on-the-spot advice and action.

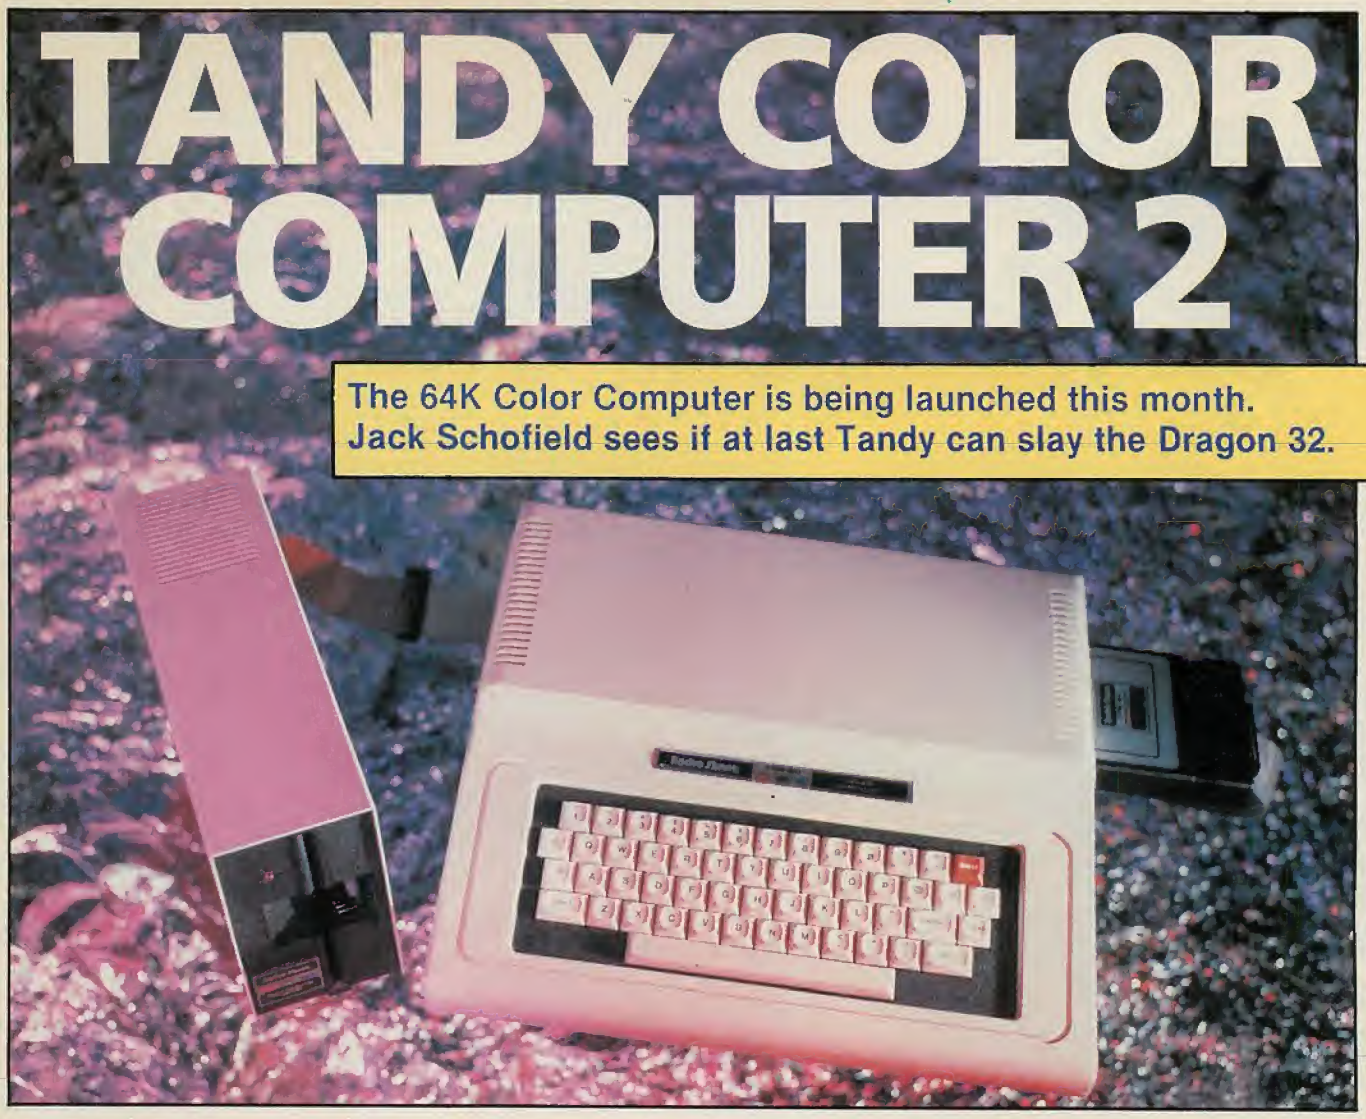
TANDY COLOR COMPUTER 2

The 64K Color Computer is being launched this month. Jack Schofield sees if at last Tandy can slay the Dragon 32.



THE TANDY Color Computer was launched in late 1981, and represented a significant shift in approach by Tandy Radio Shack. It used the powerful Motorola 6809 chip, rather than the Tandy standard Zilog Z-80, and it offered colour, sound, a cartridge slot and joystick ports. Like the Texas Instruments TI-99/4a and Atari micros, it was aimed at the consumer rather than the enthusiast.

Unfortunately, Tandy had not reckoned on a mythical fire-breathing monster from the Welsh hills, which devoured the U.K. market before the Color Computer really got going. The Dragon 32 offered remarkably similar features to the Color Computer. In addition, it had a better keyboard, twice as much memory, and cost a lot less. In fact, when the 32K Color Computer was born, the Dragon was virtually half the price.

Tandy could not outsell Dragon on the availability of software, because by choosing the 6809 it had cut itself off from its own software base. Neither could it sell on the availability of peripherals: few Dragon 32 buyers realised how long it would take Dragon Data to offer a proper system, and even fewer cared. Nor could Tandy beat Dragon at marketing, because the Dragon 32 was taken up by Boots the Chemist — one of every Briton's favourite stores.

Now Tandy is having another attempt. It has given the Color Computer a face-lift: more memory, a better keyboard and a fresh lick of paint. Also it has cut the price of the existing models fairly dramatically. The 32K Extended Basic model is down from £379.95 to £299.95, and the 16K standard model from £239.95 to £179.95. The cost of a disc drive with controller has dropped too, from £459.95 to £349. In spite of all this, the 64K Color Computer remains an ugly duckling, as will be seen later.

However, Tandy has provided it with the potential to be a swan, by implementing the Unix-like OS-9 operating system on the 64K model. This offers real concurrent operation or multi-tasking. It offers multi-user facilities, so you can hang an extra terminal off the CoCo's serial port, plus login, password protection and tree-structured directories. In several respects the 64K CoCo gives machines like the IBM PC a good run for their money, since the 6809 is as much of a 16-bit chip as the Intel 8088 which powers the IBM.

The new Color Computer makes a good first impression, and sports a smart grey finish instead of Tandy's usual silver. The case is solid and extremely well finished. The Tandy leaves the Dragon slain in overall appearance.

The keyboard also appears to be good. Gone are what the Americans call Chicklet keys, after the popular sugar-coated chewing gum. However, the keys have a stiff touch and very little travel. The typing quality is well below that of the Atari XL range, BBC Model B, Sharp MZ-711, and even the Dragon. Chicklet keys positioned over a membrane worked better than they looked; the new keyboard looks better than it works, but it is an improvement.

Like the 32K CoCo and the Dragon itself, the new model has a limited number of keys and a very limited character set. The 64K CoCo has only 53 keys: no function keys, no numeric keypad, no Escape key, not even a Control key, and the keys still lack auto-repeat. The character set is still more limited. The 53 keys produce only 63 alphanumeric characters and symbols. The rest of the 255 available mainly comprise a weird and wonderful collection of block-graphics characters in a range of unexciting colours.

Thus, like the Dragon, the 64K CoCo lacks a lower-case character set, which even the Apple IIe has. Of course it is possible to use inverse caps in place of lower-case

letters, or you could reconstruct the character set to include true lower case, but in this day and age it should not be necessary. It is not good enough, and that applies for the 64K Dragon too.

Powering-up reveals the familiar CoCo/Dragon hideous green screen with black letters, and only 32 characters by 16 rows of text. The display is not as awful as that of the *Practical Computing* Dragon, but most current machines do better.

Only 24,871 bytes of RAM are free to Basic. It seems that, again like the Dragon 64, the 64K CoCo is a 32K machine that allows you to grab extra memory if you want it. Unfortunately the review machine had no documentation and I never calculated how to do so. Typing Exec did not work and on the 64K Dragon this gives 41,241 bytes free, which is more than the Commodore 64. On the CoCo it crashed the machine.

In its 32K mode, the CoCo has the same good but slightly old-fashioned Microsoft Extended Color Basic as before, and the same rotten Microsoft line editor. Again, this is not adequate by today's standards. Ataris have had full-screen editing since 1979, so Tandy and Dragon should be able to offer it now too.

The Color Computer becomes a more attractive machine when you plug a disc-controller cartridge into the port on the right-hand side, then plug in one or two disc drives. Preferably two, because copying a full disc with one drive involves five insertions of the source disc and five insertions of the destination disc.

With discs connected, the 64K CoCo offers 22,823 bytes free to Basic. The discs take up less RAM than Atari discs, but more than the Commodore 64 ones. Disc operation is simple and straightforward, though the drives are slow and noisy. The regrettable thing is that, without warning, the operating system writes over your old files if you happen to use the same name as an existing file. There is no friendly

Are you sure (Y/N)?

or

Replace existing file?

The 64K CoCo comes into its own after booting the OS-9 disc-operating system, which I had never used before. It was written by Microware Systems Corporation in America especially for the 6809 chip, and was modelled on the Bell Labs Unix operating system.

Anyone who is familiar with Unix, or the Unix-like MS-DOS/PC-DOS version 2 from the IBM PC, will find OS-9 even easier to use. Tandy's excellent documentation comes in a slip case and consists of one booklet *Getting Started with OS-9* plus three spiral-bound manuals.

Disc feature

OS-9 is on a single disc and the whole package costs £69.95. It has many sophisticated features normally found only on very expensive machines of, say, £5,000 to £50,000. It has a kernel, a shell and a hierarchical file structure, so you can organise material in directories, sub-directories and so on. It has device-independent input and output, with Pipes so that the output of one program can become the input of another.

In Unix you can run several programs simultaneously if you have enough memory, by adding & to the command. Similarly with OS-9 you can have multi-user operation and hang an extra terminal from the back of your Color Computer. Pretty amazing for a toy home micro.

OS-9 allows Unix-like commands such as

```
dir ! sort >/P&
```

which does a file directory, sorts it and sends it to the printer but hands the prompt back straightaway so that you can do something else at the same time. Or, for example,

```
dir >/P& list myfile& copy oldfile newfile;
  del yourfile
```

sends a directory to the printer at the same time as typing Myfile on the screen and, concurrently, copying from the old file to the new file. When that's done it deletes your file. It is all done by one command line.

OS-9 comes with a good assembler, a text editor and an interactive debugger, so the assembler programmer will be very happy with it. There's an OS-9 Basic too, not supplied for review. The OS-9 prompt is tedious, reading "OS-9" all the time. However, you only have to type -P to kill it, then remove the echo, and the environment is so convincing that in a few minutes you believe you are using Unix on a DEC mini — except that you cannot browse through Usenet, the anarchic message network.

The 64K CoCo is not perfect. Screen width is a problem because of the way copious directory information is wrapped around. Also, Unix commands are traditionally all lower case, so the CoCo's insistence on capitals only, mixed with inverse capitals pretending to be lower case, is a pain. Finally, the software-driven real-time clock which OS-9 provides is hopelessly inaccurate, being configured for the American mains. Still, short of spending £5,000 on an IBM PC XT or Fortune 32:16, a 64K Color Computer with OS-9 provides the most fun you can have in computing other than playing Defender.

Incidentally, OS-9 has a serious purpose: to make available a substantial amount of business software which runs under this operating system. However, none was available for review, and it is probably all American anyway.

Conclusions

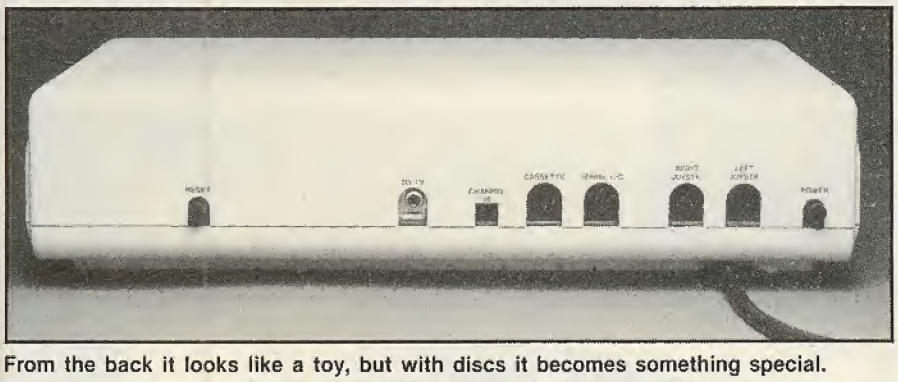
● On its own, the 64K Tandy Color Computer is a moderately good home micro with a number of serious limitations, particularly in the screen display and lack of lower-case letters.

● With the OS-9 operating system, the 64K Color Computer becomes a powerful and interesting machine which potentially offers the serious user facilities far above its price level.

● If OS-9 software becomes available, and the Color Computer proves big enough to take it, this could give it serious business applications.

● In any event, the wealth of error messages, excellent assembler facilities and Unix-like power make OS-9 far superior to CP/M, and a valuable learning tool for anyone interested in current developments in operating systems.

● The 64K Color Computer will be available from Tandy stores and computer centres at a price to be announced. Contact Tandy, Tameway Tower, Bridge Street, Walsall, West Midlands. Telephone: (0922) 648181.



From the back it looks like a toy, but with discs it becomes something special.

*portable version

The 64K Color Computer is fast at writing to the screen, but the standard Benchmarks show the Microsoft Basic running at its usual leisurely pace.

LSI OCTOPUS

A new image and a massive promotion budget are to accompany the launch of LSI's business micro. Glyn Moody has been finding out what the fuss is about.

A LITTLE OVER a year ago, LSI computers launched its M-Four, which combined eight-bit and 16-bit CP/M operating systems on one machine, implemented via dual processors. At the time there was plenty of tried and tested software for the ageing CP/M-80 but too little for the up-and-coming CP/M-86 to justify a leap of faith in that direction. During this last year things have moved on, and practical 16-bit software is starting to come through. Any system that can offer the best of both worlds is clearly attractive.

LSI has now extended the M-Four to include a wide-ranging expandability while adding CP/M Plus and Concurrent CP/M in dual 86/80 form and MS-DOS. Since the obvious name for the new product has been pre-empted by Sord, the new machine has been duly christened Octopus.

Hitherto LSI's marketing people have been content to maintain a fairly low profile, and sales have grown quite respectably on their own. However, the Octopus is being launched with the full treatment — Channel 4, no less — and an overall publicity budget of over half a million pounds.

It is big money for a firm that had sales of £3.5 million in the year to June 1983. But LSI forms part of the CPU group, which has over five times the turnover and is quoted on the Unlisted Securities Market. The LSI range is sold through an interesting mixture of 12 franchises and a dealer network.

Three-box format

The Octopus adapts the standard three-box format: the monitor and keyboard are separate and there is a low, squarish main unit in off-white polyurethane. On a desk top it is a rather more manageable than its predecessor.

The entry-level system includes one 400K floppy disc and 128K RAM but no monitor. It costs £1,530 plus VAT. The first real usable option offers two 400K floppies and a monitor, together with bundled accounting software for £2,090. Winchester options start at £3,290 for one 5Mbyte floppy.

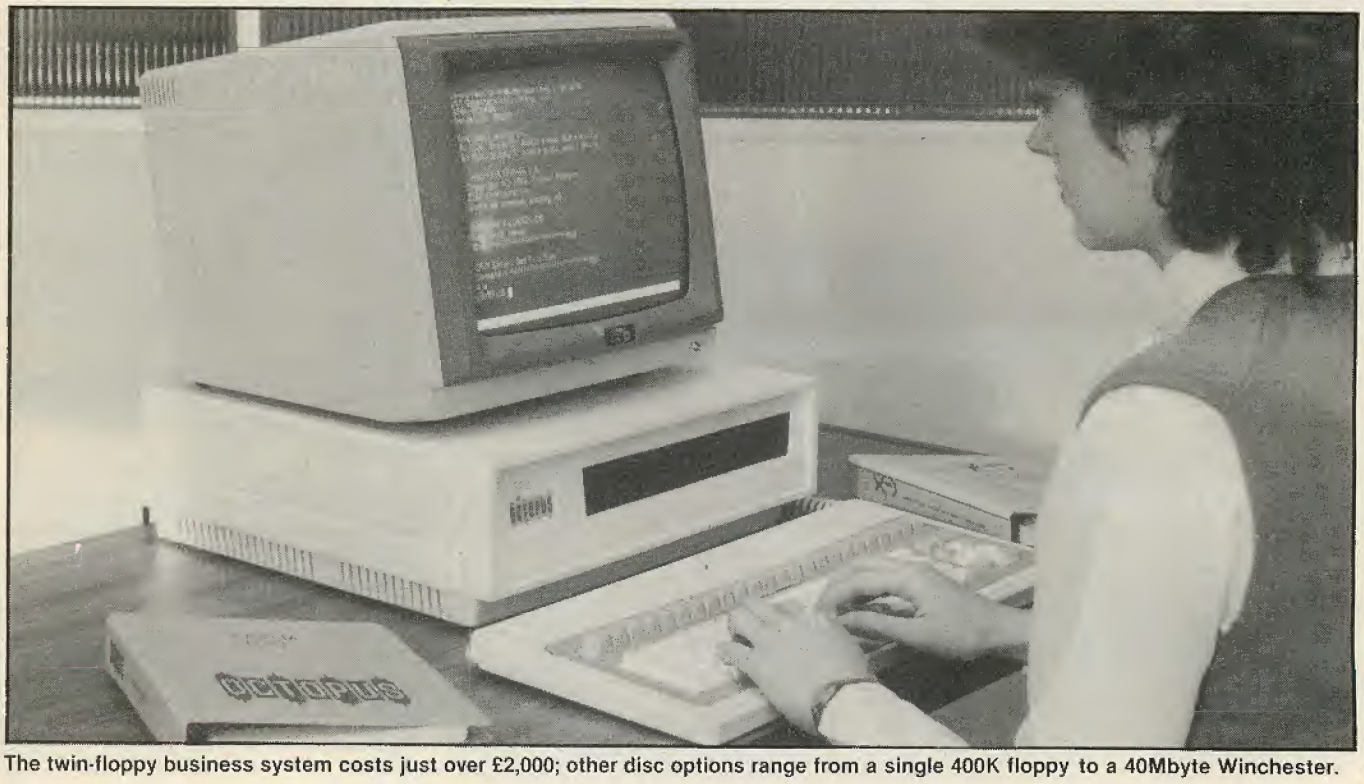
Two hexagonal screws secure the back of the main unit. A neat modular layout with tidy wiring is to be found inside. Everything possible is earthed, a feature which is indicative of LSI's long-term plans. After the British and European launches the company intends to start marketing the Octopus in the U.S., where stringent safety regulations prevail.

The power supply occupies the left-hand side of the unit, viewed from the front, positioned next to a small fan and loudspeaker. Two half-height Shugart 5.25in. floppies, or one floppy plus a

Benchmarks

The Octopus will be released with Digital Research's Personal Basic as standard. It was not available on the preview machine, so Microsoft Basic-80 Version 5.2 running under Concurrent CP/M-86/80 was used. It requires about 24K of RAM. The full 16-bit PBasic, when it comes, is unlikely to perform Benchmarks very much better. All timings are in seconds.

	BM1	BM2	BM3	BM4	BM5	BM6	BM7	BM8	Av
HP Series 200 Model 16— 68000	0.2	0.6	1.4	1.6	1.7	2.8	4.3	15	3.4
Orion—8086	0.6	2.1	4.8	4.9	5.8	10.5	16.7	13	7.3
Octopus Z-80/8088	0.8	2.5	7.5	7.4	7.9	13.6	21.9	38.5	12.5
IBM PC—8088	1.2	4.8	11.7	12.2	13.4	23.3	37.4	30	16.9



The twin-floppy business system costs just over £2,000; other disc options range from a single 400K floppy to a 40Mbyte Winchester.

letters, or you could reconstruct the character set to include true lower case, but in this day and age it should not be necessary. It is not good enough, and that applies for the 64K Dragon too.

*portable version

The 64K Color Computer is fast at writing to the screen, but the standard Benchmarks show the Microsoft Basic running at its usual leisurely pace.

LSI OCTOPUS

A new image and a massive promotion budget are to accompany the launch of LSI's business micro. Glyn Moody has been finding out what the fuss is about.

A LITTLE OVER a year ago, LSI computers launched its M-Four, which combined eight-bit and 16-bit CP/M operating systems on one machine, implemented via dual processors. At the time there was plenty of tried and tested software for the ageing CP/M-80 but too little for the up-and-coming CP/M-86 to justify a leap of faith in that direction. During this last year things have moved on, and practical 16-bit software is starting to come through. Any system that can offer the best of both worlds is clearly attractive.

LSI has now extended the M-Four to include a wide-ranging expandability while adding CP/M Plus and Concurrent CP/M in dual 86/80 form and MS-DOS. Since the obvious name for the new product has been pre-empted by Sord, the new machine has been duly christened Octopus.

Hitherto LSI's marketing people have been content to maintain a fairly low profile, and sales have grown quite respectably on their own. However, the Octopus is being launched with the full treatment — Channel 4, no less — and an overall publicity budget of over half a million pounds.

It is big money for a firm that had sales of £3.5 million in the year to June 1983. But LSI forms part of the CPU group, which has over five times the turnover and is quoted on the Unlisted Securities Market. The LSI range is sold through an interesting mixture of 12 franchises and a dealer network.

Three-box format

The Octopus adapts the standard three-box format: the monitor and keyboard are separate and there is a low, squarish main unit in off-white polyurethane. On a desk top it is a rather more manageable than its predecessor.

The entry-level system includes one 400K floppy disc and 128K RAM but no monitor. It costs £1,530 plus VAT. The first real usable option offers two 400K floppies and a monitor, together with bundled accounting software for £2,090. Winchester options start at £3,290 for one 5Mbyte floppy.

Two hexagonal screws secure the back of the main unit. A neat modular layout with tidy wiring is to be found inside. Everything possible is earthed, a feature which is indicative of LSI's long-term plans. After the British and European launches the company intends to start marketing the Octopus in the U.S., where stringent safety regulations prevail.

The power supply occupies the left-hand side of the unit, viewed from the front, positioned next to a small fan and loudspeaker. Two half-height Shugart 5.25in. floppies, or one floppy plus a

Benchmarks

The Octopus will be released with Digital Research's Personal Basic as standard. It was not available on the preview machine, so Microsoft Basic-80 Version 5.2 running under Concurrent CP/M-86/80 was used. It requires about 24K of RAM. The full 16-bit PBasic, when it comes, is unlikely to perform Benchmarks very much better. All timings are in seconds.

	BM1	BM2	BM3	BM4	BM5	BM6	BM7	BM8	Av
HP Series 200 Model 16— 68000	0.2	0.6	1.4	1.6	1.7	2.8	4.3	15	3.4

IBM PC—8088	1.2	4.8	11.7	12.2	13.4	23.3	37.4	30	16.9

The twin-floppy business system costs just over £2,000; other disc options range from a single 400K floppy to a 40Mbyte Winchester.

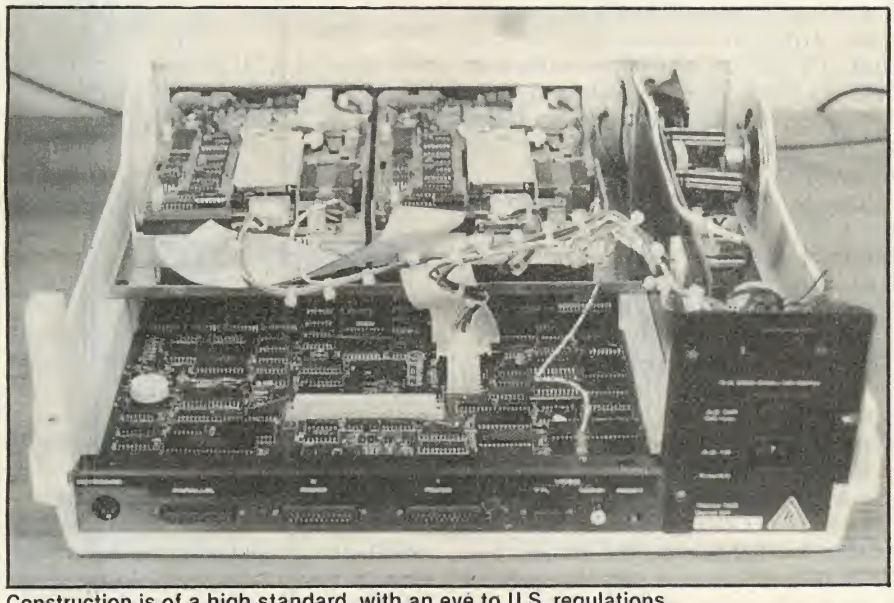
Winchester, are mounted in the front. Along the back of the unit you find: a socket for the serial keyboard input; a parallel I/O, which is a superset of the Centronics port; two RS-232C ports; a TTL output that connects to an RGB monitor or TV set VHF input; and a composite-video monochrome plug. There is a tiny Reset button — no danger of accidentally pressing it. Finally there is the mains input, along with a socket to allow the monitor to be powered from the Octopus itself.

Inside, the motherboard nestles partly under the disc units at the front, and is mounted so as to slide out as a single unit. The PCB itself is of an advanced multi-layer construction which allows very neat and compact board layout, and reduces circuit noise. It is populated in Scotland. The few wires and piggybacks visible would, I was assured, be incorporated on to the main board for the production models.

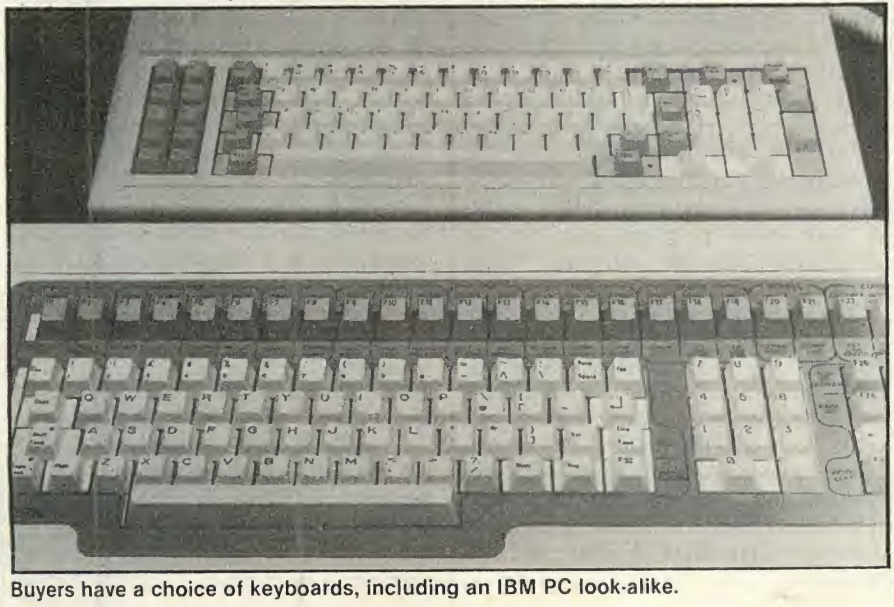
The two processors are an Intel 8088-2 running at 8MHz and a Zilog Z-80B at 6MHz. The standard model comes with 128K plus parity. A 32K EPROM contains the system firmware, and there is room for another. An 8087 maths co-processor chip cay be piggybacked into the 8088 slot as an extra. There is a real-time clock powered by a rechargeable battery. It lasts about 3½ weeks when the Octopus is switched off.

One striking feature of the board is the large expansion slot towards the back, next to the I/O ports and circuitry. It is perhaps the key element of the Octopus and its philosophy. A superset of the Multibus system is used, and up to four expansion boards can be progressively stacked on top of each other. One card mates via a bridging piece with the bus slot beneath and provides a similar slot for further expansion. The bus effectively flows through the additional boards.

Options include a communications board with four RS-232C and one RS-422 ports. Extra RAM up to 512K and an Arcnet-type LAN will also be available. A graphics board allowing a 325-by-800 resolution and a BT-approved internal modem are also promised. LSI is encouraging third-party suppliers to add to this range.



Construction is of a high standard, with an eye to U.S. regulations.



Buyers have a choice of keyboards, including an IBM PC look-alike.

The keyboard is connected via a 14ft. coiled cord which plugs into the rear of the Octopus. LSI offers a straight IBM look-alike keyboard — even down to the tedious Backslash key where Shift should be. Alternatively, you can have a slimmed-down version of the popular M-Four word-processing keyboard which has no fewer than 32 programmable function keys. This may sound like overkill but it can be put to good use.

The LSI-supplied monochrome monitor is a 12in. Panasonic which uses a P-34 green phosphor. A colour option is fitted as standard on the Octopus, so colour monitors of varying resolution are also available. Other features include a sound channel installed as firmware, and provision for a cartridge tape back-up. A mouse will be available later.

On powering-up, the machine goes into a self-diagnostic routine. The screen shows the following in succession:

```
Testing . . .

Main Processor
PROM
DMA Controllers
RAM
Interrupt Controllers
Floppy discs
```

Any intelligent option boards present on the expansion bus show up in a similar way.

The system may be reset at any time by pressing Control, Shift and Delete simultaneously — the same three-key system as the IBM. After the diagnostic routine the Octopus gives a choice of booting up the Winchester or the floppy. Four operating systems are available: CP/M, MP/M, MS-DOS and the company's proprietary system Elsie. After you select a disc the system searches for all bootable systems and then presents a menu of options.

Since CP/M-86/80 and MP/M-86/80 have been available for some time on the M-Four, the most interesting developments on the Octopus are the LSI versions of CP/M Plus and Concurrent CP/M for the dual-processor architecture. The CP/M Plus running on the preview machine was only the beta-test version, though evidently Digital Research has assured LSI that the final release is to be available "real soon now". It will then form the basic operating system offered as standard on the Octopus.

Loading CP/M Plus produces the following screen output:

```
Available Drives

A:W
B:W
C:LH drive 48 tpi automatic
M:128K memory
P:patchable format
```

This shows a floppy and Winchester system where the hard disc has been partitioned by system software into two

(continued on next page)

(continued from previous page)
drives A: and B:. Drive C: is the 400K floppy drive to the left of the Winchester unit.

Drive M: represents the virtual disc storage allocated in RAM by CP/M Plus, and the 128K its total extent. With a 256K system, 128K is normally allocated as a RAM disc, and the remaining 128K then serves as normal RAM.

The P: drive refers to a patchable format option. The physical drive C: is set up to read IBM PC and LSI disc formats automatically. Using the configurable P: drive, practically any other disc format — except the Sirius — can be read by specifying the relevant parameters using the Parmgen command.

This is a standard routine supplied as part of the 370K of system utilities. The version that I saw also allowed scroll speed to be varied from a gentle flow to a hiccoughing line-jump. Various display-width and colour options may also be set. The final version will have the command structure for matching the P: drive's parameters to other disc formats, either via menus or directly.

Two other useful utilities are included with the Octopus. Keygen allows the 32 function keys to be programmed via a series of menus. The program detects automatically whether the keyboard is of IBM or LSI type and adjusts the options accordingly. An obvious choice is the set of standard WordStar commands, and booting CP/M Plus sets them as default. LSI produces a keyboard overlay for people using the function keys in this way.

The Fontgen command allows whole character sets to be set up and modified. The Octopus comes with two standard files of founts, for 80-character screen width, and a narrower one for 132-character display. Up to 256 characters can be defined in two blocks of 128. Using simple menus of instructions, new characters can be defined or old ones modified.

Specification

CPU: Intel 8088-2 and Z-80B
RAM: 128K, expandable to 768K
Portability: typical main unit weighs 15lb.; a carrying case is available
Size: main unit is 15.7in. deep by 17.7in. wide by 5.7in. high
Display: monochrome 12in. allowing 80 columns × 25 lines or 132 columns × 29 lines, characters are formed on 12 × nine and 11 × six matrices respectively
Keyboard: detachable; choice of IBM-type or LSI word-processing model
Interfaces: Centronics-type parallel port; two RS-232Cs
Discs: one or two 5.25in. Shugart half-height floppies, formatted capacity 400K per drive; 800K optional; Winchester discs of 4, 10, 20 and 40Mbyte available
Software in price: CP/M Plus 86/80 and Personal Basic from Digital Research; Axis accounting package with business system
Hardware options: expansion boards for RAM, communications, internal modem, and networking; also 8087 maths co-processor
Manufacturer: LSI Ltd, St John's, Woking, Surrey. Telephone: (04862) 23411
U.K. prices: £2,090 for 128K system comprising screen, keyboard, twin disc drives plus Axis software

Attractive

In 80-column format the character is displayed as a blown-up 13-by-nine pixel representation. Moving around this grid with the cursor-control pad, individual pixels can then be added or expunged. Working with the 132-column fount the character is formed on an 11-by-six pixel grid. The founts can then be stored and loaded at any time. This whole feature is very attractive and well implemented.

Similar options are available on the Concurrent CP/M-86/80 system. It is fully operational now, but because it requires about 128K of RAM Concurrent CP/M is not supported on machines with less than 256K RAM; the recommended level is 512K. CP/M Plus, by contrast, takes only 40K including buffer and command interpreter, most of which is separate from the 64K directly addressable by the Z-80 under CP/M.

The Octopus uses the 8088 as a slave to the Z-80. All I/O is handled by the 16-bit processor and so is coded exclusively in 8088 instructions. Only about 2K of the Z-80's precious 64K address space is therefore taken up by systems software. This arrangement also enhances response times — so much so that LSI says well tested eight-bit implementations of applications software are often still preferred to bug-ridden 16-bit upgrades. WordStar is a case in point.

Concurrent CP/M is signalled by an A> prompt for User 0, and 1A> for User 1 — up to 3A> for user 3. A status line appears at the bottom of the screen. One of the neat uses of concurrency is to allow different levels of operation at the same time. For example, while modifying one fount using Fontgen, quick reference can be made to another, simply at the touch of a key. CP/M listings of a directory can be checked for the presence or otherwise of files while a WordStar file is read or modified. Eight-bit and 16-bit programs can be run concurrently on the different virtual screens.

MP/M-86/80 supports the same operations with the addition of multi-user capability. Up to six intelligent terminals can be hooked up to the system via the RS-232Cs, though quite what the response would be is another matter. The system showed no obvious degradation with two users and, like Concurrent CP/M, allowed eight-bit and 16-bit software to be mixed. A multi-user concurrent version is also promised.

As in the case of CP/M Plus, LSI is still rather waiting on Digital Research for the networking option. The promised DR Net — a system like Arcnet that uses token-passing to give priority for transmission to each machine in turn — will apparently look like a distributed MP/M system with concurrency. The speed is about 2.5Mbit/second.

The basic system includes CP/M Plus 86/80 and Digital Research's Personal Basic. The £2,090 business system comes with an accounting, invoicing and stock-control package called Axis. For an extra £295 you can buy the Octosoft range of software. It consists of Plannercalc, a fairly cheap and rather idiosyncratic spreadsheet system; Lexicom, a menu-driven word-processor; and Rescue a well thought of database package. Clearly LSI felt the need to offer the canonical three applications, but this seems rather a motley bunch. The manuals for each are reasonably full if unexcitingly produced.

Unfortunately the same cannot be said of the manual for the Octopus itself. One slim A5-size ring-bound volume introduces the machine, CP/M-80/86 Plus and Personal Basic. There is no index. Too much is assumed for it to be much use to a beginner, and it is too skimpy for the practised user. When the basic product is so well thought-out it seems a shame to spoil the ship with such flimsy documentation.

Conclusions

● The Octopus is a well designed machine. It is soundly based in established technology but also incorporates some original features.

● The dual-processor architecture is a real gain, in terms of both present performance and future upgrading.

● Perhaps the most significant feature of the Octopus is its versatile expansion bus. A small business could safely buy the machine secure in the knowledge that upgrade paths will be readily available.

● With its wide range of operating systems, the Octopus is well placed to benefit from new software as it comes through. The systems software includes useful extra utilities like Parmgen and Fontgen.

● The bundled accounting software is a poor choice for a system which is otherwise well suited to the business user. It would be far better to make the price even more competitive, and allow end-users to choose their own application software. Businesses are no longer content to accept any old system. The Octosoft package is also unexciting.

● The Octopus user manual is a disappointment, though LSI has promised a revision. Manuals represent potentially the most important link with the user and should be as full and easy to understand as possible. When LSI produces a worthy companion to its machine, the Octopus will represent a good buy.

SEIKO 8600

Multi-user systems seem attractive — as long as software is there to run them. We put the Seiko to the test and Glyn Moody discovered it to be a practical proposition for business use.

THE ENTRY PRICE for the Seiko Series 8600 micro is £3,587 plus VAT for a 16-bit machine with 128K RAM and one 655K floppy. So it is hardly cheap, but then neither is it really representative. The Series 8600 is designed as a multi-user system for small professional offices and businesses.

A more realistic starting price would be £5,270 for two users. That includes one floppy and one 10Mbyte Winchester with 256K RAM, in addition to the two terminals with keyboards. Three-user options start from £8,256.

The hardware for the 8600 is produced in Japan. The systems software in America, from a company called Seicom which is jointly owned by Seiko and Science Management Corporation. Sole distribution rights in the U.K. are held by Intelligence Distribution Ltd. The plan is to sell the 8600 through a network of 80 dealers.

We reviewed here a two-user system with 20Mbyte Winchester. Physically, it is arranged as the natural progression from the IBM three-box configuration: one central processing unit connected to two terminals, each with a separate keyboard and VDU.

The squat rectangular box of the central unit has two convenient recesses in its base for easy lifting. At the front, to the left, is the floppy and next to that the Winchester. At the back you find the mains input socket and On/Off switch, printer port, four RS-232Cs and a recessed Reset button. Two simple locks at the top of this back panel release the upper lid.

The interior layout is almost spartan, chiefly because of the total invisibility of the motherboard with its 8086 processor. The board is tucked away safely in a separate compartment underneath; access is difficult, though not explicitly forbidden. By contrast, the disc-drive units are a model of easy installation and removal. The excellent blow-by-blow account in the manual gives full details — with illustrations — of which wire to put where. Good design means that it is practically impossible to hook anything up incorrectly.

Three extra 128K RAM cartridges take the total RAM to 512K and are similarly easy to load. A fourth slot is for communications. Although the hardware is available now, the software that will allow direct mainframe interfacing and terminal emulation — all at a cool 300Kbaud — has not yet been produced. The power unit is sealed off in a further separate compartment, with a small, fan opening on to the main recess containing the discs.

The 12in. monitor with standard P-31 green phosphor is set in a swivel unit that can be locked in various tilted positions. At the back there is a printer port, an RS-232C interface connecting it to the main unit, some Dip switches setting baud rates, and the keyboard port.

The keyboard is equipped with standard QWERTY-layout keys, a numeric pad with separate Enter key and cursor controls, and

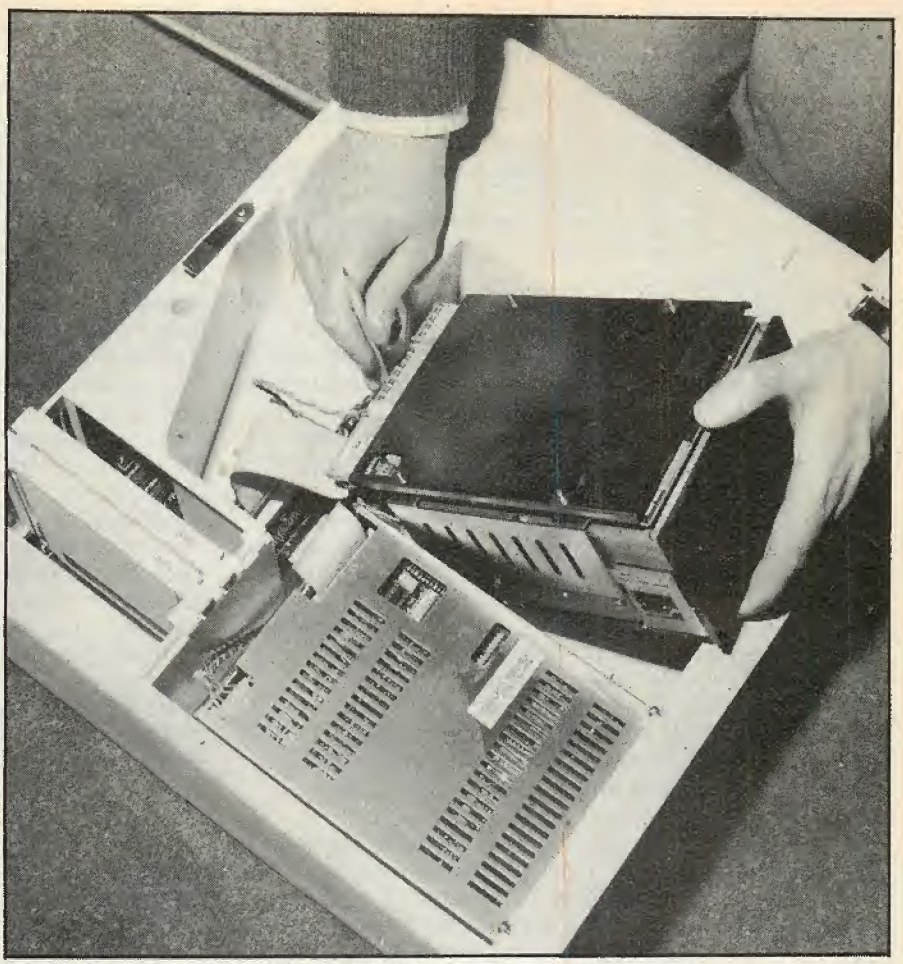
Benchmarks

Timings are in seconds. Those for the Seiko were produced from the eight standard routines — see last month's issue — written in Basic-86 running under MP/M. It is perhaps not surprising that running the Benchmarks simultaneously on two terminals took about twice as long as running one terminal only. What is surprising is that running the Benchmarks while the second terminal supported Basic, but ran no program, produces almost identical figures. This is a result of Basic's constant keyboard interrogation, which uses the central processor.

	BM1	BM2	BM3	BM4	BM5	BM6	BM7	BM8	Av
OEM Orion — 8086	0.6	2.1	4.8	4.9	5.8	10.5	16.7	13.0	7.3
Seiko 8600 — 8086									
single user	1.2	4.0	8.7	8.6	10.3	19.1	29.7	23.7	13.2
two users	2.4	8.4	17.6	18.0	20.7	39.0	60.5	47.8	26.8
IBM PC — 8088	1.2	4.8	11.7	12.2	13.4	23.3	37.4	30.0	16.8

a host of defined and definable functions. Common keys like Esc and Ctrl are joined by others such as Tpwr and G1/G0. Tpwr switches on Typewriter mode: pressing any ken then produces lower case, and pressing a key with Shift held down gives the upper case or typewriter equivalent. Its setting is signalled by a built-in LED. The G1/G0 key then produces lower case, and pressing character sets available on the terminal, also has an LED warning. The default option G0 is the standard American ASCII set. When G1 is pressed each key produces a graphics symbol which closely resembles Sumerian cuneiform. Perhaps this forms part of some far-sighted marketing plan. Apart from the 10 function keys, there is also a range of edit function keys, used for on-screen editing.

The monitors with their keyboards are no mere dumb terminals. Each set comes complete with an 8085 processor and a large 64K memory used for buffering, and for local activity independent of the main processor. The overall feel of the keyboard is slightly shallow, but generally acceptable. That this is a high-quality unit is reflected in the price of £1,493 for a complete user upgrade — though this also includes a plug-in 128K RAM expansion for the main unit.



Modular construction permits easy replacement of major components.

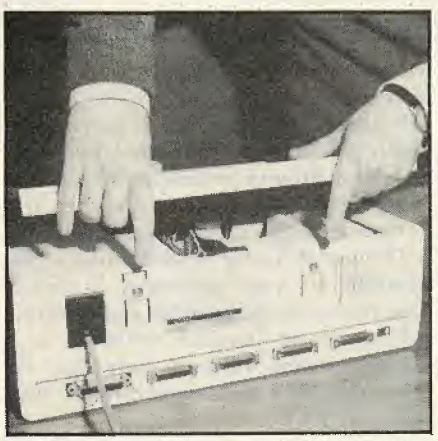
Diagnostic checks

On powering-up, the user 0 terminal identifies itself as part of the Seiko 8600 computer system, and then goes into a hardware diagnostic routine. The machine then normally requests specification of a disc drive from which it could boot the operating system. On the review machine, part of the partitioned Winchester had been set as the default.

When using the 8600 machine, one of the first things you notice is that keystrokes beep, which is rather trying for those of us who have been conditioned over the years to regard beeps as tantamount to input errors. Happily, the Seiko's rich set of control sequences allows, among other things, the keyboard to be silenced.

Control sequences are entered as a string of characters following the Esc key. Although they can in theory be entered at any point in a computation, you run the risk of them being misinterpreted by the central processor which could then lock itself into something nasty. Seiko has devised a clever system of isolating the terminals for such set-up sequences, so you should be able to stay out of trouble.

Pressing the Shift and Set-up keys simultaneously calls up a 25th line to the screen display, which is normally 80 columns by 24 lines. The extra line is the status line, and is divided into 16 sections. By using the cursor controls it is possible to change the option for the terminal by pressing the Set-up key until the desired function appears. Thus smooth scroll may be replaced by jump scroll, auto repeat set on or off, baud rates may be adjusted and, most relevantly for the Esc command sequences, the relationship of the terminal with the main processor can be altered.



Terminals are connected via RS-232 links; a Centronics interface is also provided.

Up to three 128K RAM packs drop into purpose-designed sockets.

Apart from full-duplex and half-duplex modes, the terminal can be made purely local. Then any characters generated at the keyboard are sent to the screen but not the main processor. There is also a blocking option which allows an entire screenful of input to be built up at a terminal, and then sent all in one go to the 8086 processor when you press the Send key.

You should choose Local mode when using the Esc set-up codes. They are entered without any echo on the screen — something the manual omits to mention. You press Shift and Set-up once more to remove the status line and return to the current program. Using this very powerful facility practically every aspect of the terminal can be modified: screen mode may be set to blinking or double width; windows can be created, the keyboard disabled, and so on. The manual is commendably clear in this generous facility.

The manual is generally well produced and clearly written with plenty of diagrams and examples. It includes two glossaries and a list of Do's and Don'ts. Although it could have been slightly less technical, and so less offputting for the first-time user, its main fault is the lack of an index.

(continued on next page)

Multi-user MP/M-86

Judging by the flood of new machines, 1983 was the year of the 16-bits. Signs are that "multi-user" will be one of the catch phrases of 1984. This is partly a natural consequence of the new processors: for example, multi-tasking is an automatic option for the Motorola 68000 running under Xenix. But now, even the humble CP/M is offered in its Concurrent form — a kind of poor man's multi-user system.

MP/M is Digital Research's full multi-tasking operating system. As such it shares many of the features and infelicities of CP/M. Apart from standard utilities such as Dir, Era, Pip and Type there are a number of new features specific to the multi-user environment.

The first distinction to be made is between user and console. Each physical terminal is allocated a number from 0 to 15. The system console is designated 0, and it is here that the main bootstrap messages appear. The physical console number plays no visible role during use; it is merely used by the computer for housekeeping purposes.

Independently of the console number, each terminal may be assigned a user number from 0 to 15. The maximum number of users, as opposed to consoles, under MP/M is 16. The user number refers to the space allocated on all the disc drives, whether floppies or partitioned Winchesters. Each file is stored with an attached user number and only those pertaining to the user at the terminal may be accessed.

On booting up, the user number on each console is set by convention to the physical console number: user 0 on console 0, user 1 on console 1 and so on. The user number may be changed at any time by means of the User command: keying User 6, for example, sets the current user to 6. Unlike physical console numbers, which are unique, user numbers may be shared between different consoles. Thus two consoles may be logged into user 1 for example, and they may both access user 1's files on any drive.

Certain files from other users' disc drives can also be tapped. Any file can be stored with one of two attributes: Dir and Sys. Dir locks the file into the particular user's area on the disc: only the specified user may access it. If the file is stored with the Sys attribute by user 0 — but not other users — then other users may also gain access. Files which are generally available are systems files, hence the name, and provide general utilities like Dir and Era which are needed by all users.

Information on the attributes of a file can be obtained from an extended Dir command, calld SDir. This detailed directory gives the number of bytes and records taken up by the file and the attributes of the file such as Dir / Sys, Read / Write.

Although users may only access files in their own user area, it is easy to switch user number. So in real environments password protection is vital if access to sensitive files is to be limited. Entire discs or individual files, including command files, can be protected and at three levels: read-, write- or delete- protected. To set a local password, a global password for the entire system must first be entered. This may sound labyrinthine, but in fact is only logical. If the password-setting command structure were accessible to all users, the password option on all files could then be turned off.

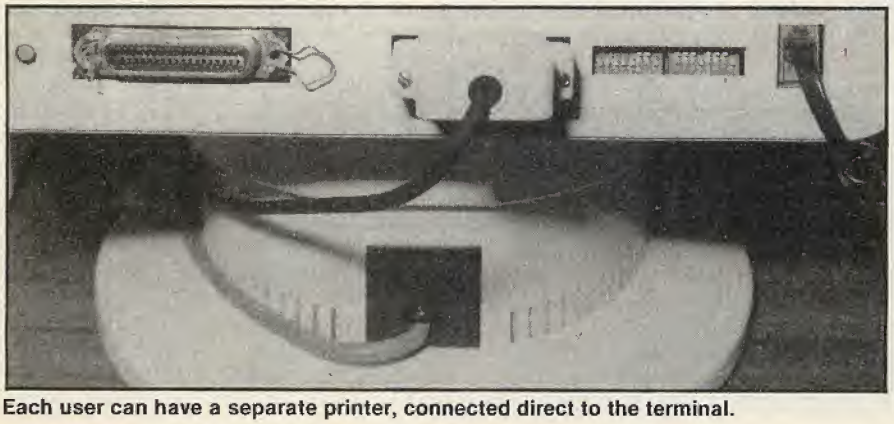
Booting-up MP/M on the review machine produced a main boot message on console 0 and user 0, and a subsidiary signal on console 1 and user 1. The prompts for the two terminals are respectively 0A> and 1A>, which signals the user numbers and drive, A being one of two partitions on the Winchester. The prompt P: is obtained when using the floppy drive. Drives are changed, as in CP/M, by entering the appropriate letter followed by a colon.

(continued from previous page)

Seiko's prices do not include any bundled software. Since the 8600 runs MP/M, CP/M-86 and MS-DOS, with the new Oasis-16 operating system promised, there should be no shortage of software. Cis-Cobol is also supported, allowing access to a wide range of business programs. The main problem is the lack of true multi-user products.

Conclusions

● The Seiko 8600 represents a well thought-out and well produced system.
● As a one-user option, it is not cheap. The full benefits are only obtained with two or three users.
● Naturally, with more users, the response time begins to falter. The Seiko is not suited to solid multi-user processing, but is ideal for professional or business use where two or three terminals are accessed frequently.
● The user-definable characteristics of the terminals are very impressive, if slightly superfluous for the intended end-market.
● There is no bundled software, so a working system will cost more than the prices quoted. For example MP/M costs £475 plus VAT.
● An otherwise excellent manual is flawed by its lack of an index, making it unnecessarily hard to use.



Each user can have a separate printer, connected direct to the terminal.

Specification

CPU: Intel 8086, 16-bit running at 5MHz
RAM: 128K, expandable at 512K
Dimensions: main unit is 19in. wide by 6in. high by 16.5in. deep
Display: 12in., 25-line by 80-character CRT; character matrix 10 by 14; two character sets supplied including ASCII, various cursor modes
Keyboards: Detached 100-key QWERTY, 10 programmable function keys, 18-key auxiliary pad, five special function keys
Interfaces: four RS-232Cs, Centronics-type printer interface, each terminal has one RS-232C and printer interface
Discs: one or two 5.25in. double-sided double-density 655K formatted; 10Mbyte and 20Mbyte hard discs optional
Software: CP/M-86, MP/M, MS-DOS, main languages and applications available but not included in price
Hardware options: communications interface, but without operating software
Manufacturer: Seiko, Japan
U.K. distributor: Intelligence Distribution Limited, Nelson House, 271 Kingston Road, London SW19 3NW. Telephone: 01-543 3711
U.K. prices: £3,587 one user, one floppy, 128K RAM; £7,168 two user, 20Mbyte hard disc, 256K RAM

No one else handles CP/M Software quite like us!

We handle one of the largest ranges of CP/M Software in the country. And since our range covers most of the major formats and is available off-the-shelf, the delivery is equally impressive.

But we don't stop there. After all it's no good having a large range if we don't handle it professionally. That's why we produce no less than a 68 page catalogue, full of information about our entire range. Back this up with honest and friendly advice, and we believe that we can offer a helping hand you won't find anywhere else.

Software Limited... Because there's more to choose from, we're the only choice to make.

NEC PC-8201

Chris Bidmead looks at the latest lap portable in the Kyocera family.

TOWARDS THE END of 1982 the Epson HX-20 blazed a trail into a new market for briefcase-size computers. An ambitious machine, it is in many ways still the most interesting of what have become known as lap portables. However, it has suffered in comparison with newcomers such as the Tandy Model 100, the Olivetti M-10 and the NEC PC-8201A which offer a screen of 40 characters by eight lines, instead of the Epson's poky 20-character by four-line LED display.

Regular readers of *Practical Computing* will notice that we are tracking the development of these machines closely, with reviews of the Tandy 100 in the August issue, and the Olivetti M-10 in December. I suspect this is because lap portables, with their emphasis on word processing on the move, hold particular interest for journalists.

Their price of around £500 for a 16K model and their inability to hook up to a colour TV distinguish them sharply from home computers like the Vic-20 that they resemble physically. Nevertheless, they do represent a class of machine that is going to be mass produced in such quantities that prices will fall quickly.

Differences

The striking similarity between the three successors to the HX-20 is not accidental. They are all versions of the same design from the Japanese firm of Kyocera, which built the original and sold it to NEC. But although they are all based on the same kernel hardware, and run similar software from Microsoft, the machines are certainly distinct from one another. Negotiations between Tandy, NEC and Kyocera have resulted in complex trading agreements, with the outcome that NEC is permitted to market its own version, the NEC 8201, in the U.K.

Comparisons with the more widely available Tandy Model 100 are inevitable. The wedge-shape of the NEC makes it significantly bigger. The increase in physical size does two things for the NEC: it allows for a comprehensive collection of I/O ports at the rear; and it makes room for a large cartridge socket on the left-hand side which is closed by a spring-loaded flap when out of use.

Another noticeable feature is the cluster of sizeable and geographically oriented cursor keys instead of the miniature in-line keys of the Tandy. Otherwise, the basic QWERTY arrangement is identical, with changes being confined to the function keys and more esoteric computer keys. On the NEC the function keys are larger and fewer, from eight down to five, although they operate as 10 keys since, with the help of Shift, each one does double duty.

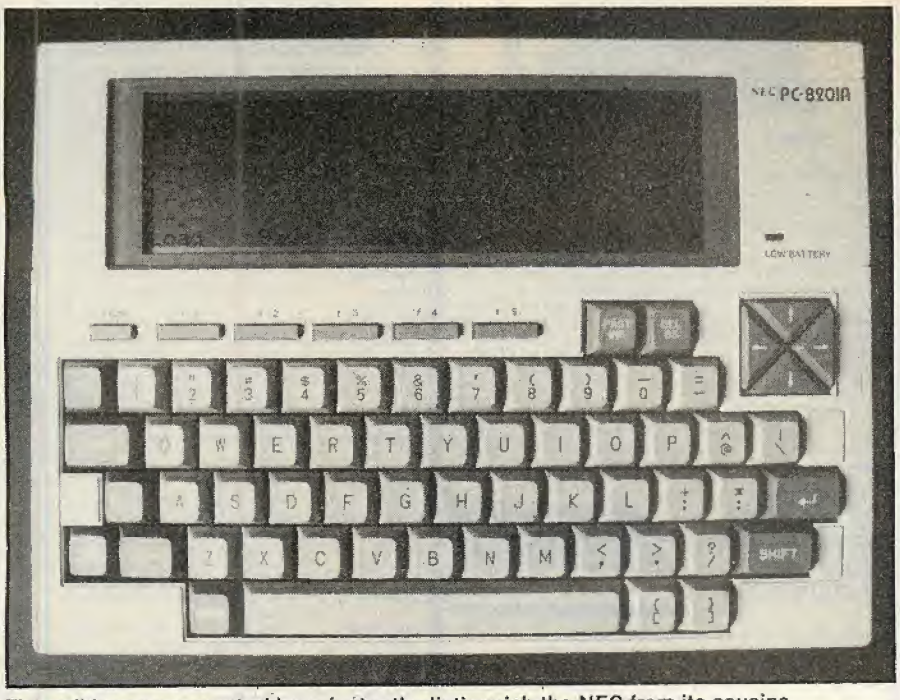
The Tandy has a ghost numeric keypad that allows the three rows of keys immediately below the 7, 8 and 9 on the top row to serve for numeric entry with the Num key locked down. On the NEC this arrangement has been omitted, and so has the Code key that permits access to foreign characters.

As in the other Kyocera machines, 32K of the address space is occupied now by ROM, with a further 16K of RAM — 8K on the Tandy — being sold as standard. Also like them, the memory size can be upgraded. The Kyocera CPU is an 80C85, the CMOS low-power version of the 8085 and a close relative of the ubiquitous Z-80. RAM enhancement ought to stop at 32K since 32K RAM plus 32K ROM makes 64K. But the NEC allows bank-switching of the RAM segment, which allows you to go on adding RAM internally up to a maximum of 64K.

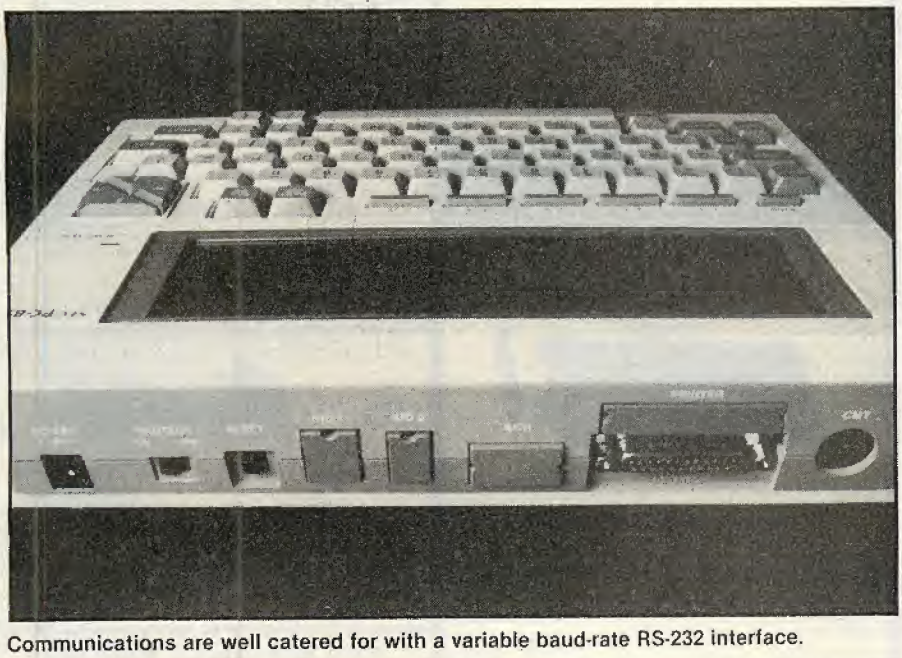
The flap-covered cartridge socket is designed to take a further 32K in the form of a CMOS RAM pack with its own batteries, which appears to the system as a third banked-out segment. This is one of the exciting aspects of the NEC, allowing you to create text or collect data in the

Specification

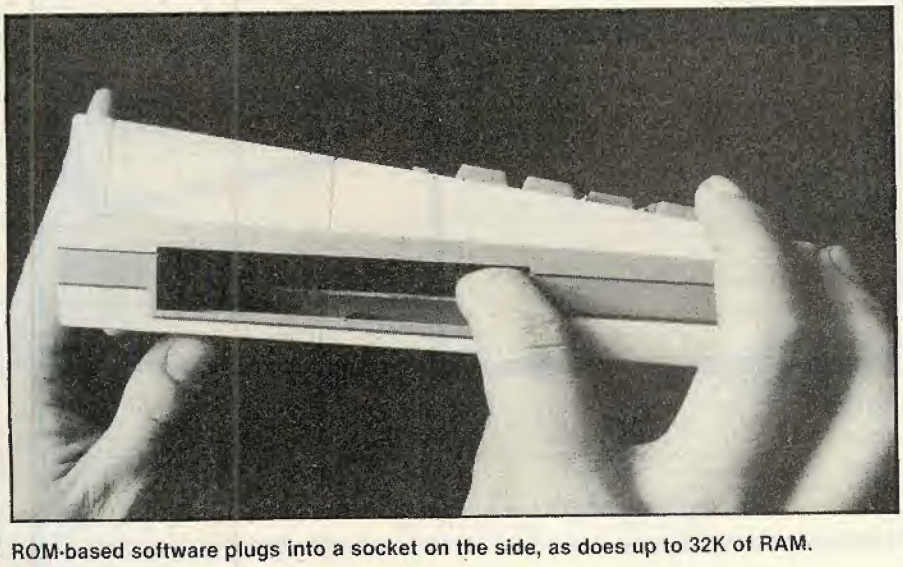
CPU: OKI 80C85 running at 2.4MHz
ROM: 32K Microsoft Basic with Telcom and Text
RAM: 16K standard, expandable to 96K
Size: 300mm. by 215mm. by 61mm.
Weight: 1.7kg. approx
Power: four AA batteries in interchangeable battery pack or optional NiCad rechargeable pack and recharger; additional built-in NiCads for back-up
Display: 40 characters × eight lines LCD; 64 × 240 dot addressable graphics
Keyboard: full-size QWERTY; five dual programmable function keys, operating as 10 geographically oriented cursor keys
Interfaces: eight-pin DIN cassette; RS-232, programmable for 75-19,200 baud; Centronics printer; HP-compatible bar-code reader; S-101 and S-102 reserved for future use, system slot for RAM cartridge
Software: 25-program cassettes supplied as standard in addition to ROM-based software
Manufacturer: Kyocera, Japan for NEC
U.K. distributor: NEC (U.K.) Ltd



The striking cursor-control keys instantly distinguish the NEC from its cousins.



Communications are well catered for with a variable baud-rate RS-232 interface.



ROM-based software plugs into a socket on the side, as does up to 32K of RAM.

RAM pack, detach it and despatch it back to base. One obstacle is that the RAM pack is not available yet; a further obstacle is the price. The pocket-size RAM packs each cost as much as a cheap dot-matrix printer, so you will probably settle for downloading data to a cassette machine.

All three new lap portables offer variations on the same suite of built-in software from Microsoft. Microsoft Basic is supplied burnt in to the ROM, but surprisingly it is not the same Basic across all the machines. NEC has said goodbye to the SCHDL and ADDRSS programs that on the Tandy and Olivetti are integral with the machine. The additional space is used to offer more comprehensive Basic, closer to GWBasic now appearing on all the new 16-bit hardware.

The word processor Text was covered in detail in the August 1983 issue of *Practical Computing*. SCHDL and ADDRSS are elementary database programs that act as diary plus name-and-address book respectively. They offer nothing that you could not knock up for yourself using the Find facility in Text, but NEC provides them in Basic in the Personal Application Kit — a cassette of 25 programs of varying utility.

Be warned that applications programs are not necessarily transportable across these superficially similar machines. Transfer rate and coding differences in the cassette interfaces make it impossible to get data from a Tandy cassette on to an NEC machine, and vice versa.

A machine of this sort can be expected to make heavy use of the RS-232 interface in communication with non-portables. All the Kyoceras come with a terminal emulating program that allows you to configure the baud rate and transfer files. Unfortunately, the XOn/XOff handshaking did not work convincingly, and I had difficulty matching baud rates.

One advantage of the NEC is the way it lets you carry out file housekeeping at the level of the menu presented at start-up. All you have to do is push a few function keys, using the cursor to identify files you want to delete or rename. Saving to and from cassette can be done interactively at this level. This is more convenient than the way the Tandy requires you to go into Basic and write out the Basic commands in full.

Conclusions

● The NEC is functionally very similar to the Olivetti M-10 and the Tandy Model 100, being from the same manufacturer Kyocera.

● It is significantly cheaper than the Tandy. The basic 16K NEC costs £475 and the 8K Tandy costs £499.

● Unique in its class, it can be enhanced up to 96K, equivalent to 12,000 words of text.

● The doubt hanging over the serial comms line is unfortunate. Like others who have mentioned this problem, I cannot swear it was useless because of the complexities of the RS-232 standard.

BBC Microcomputer System

OFFICIAL BBC COMPUTER DEALER

This is the best microcomputer currently on the market. 32K RAM. 32K ROM. 8 modes of operation, full colour, full-size keyboard. Internal expansions such as disc interface, speech synthesizer, Econet interface – in short it is a personal computer capable of expanding into a small business system.

BBC Microcomputer Model B	£348 + VAT	£399.00
BBC Mod B + disk interface	£409 + VAT	£469.00
BBC Mod B + Econet interface	£389 + VAT	£447.35

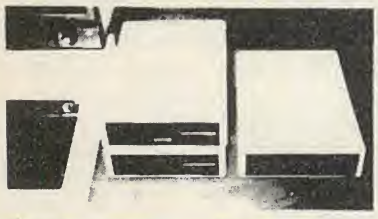
100% BBC COMPATIBLE MITSUBISHI AND TEAC SLIMLINE DISK DRIVES



These drives are supplied ready cased with all the necessary cables, formating program and user disk system guide.

There are some useful utilities included, e.g. Epson Screen Dump Program, Memory Dump, Free, Duplicate, Merge and Relocate. Power consumption of these drives is very low (0.2A typ. at +12V, 0.4V typ. at +5V per drive). Power is taken from the BBC computer.

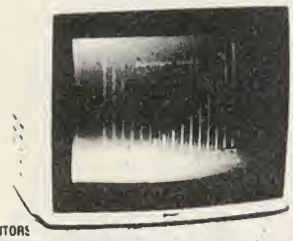
Single drive 100K 40 tracks	£169 + VAT	£194.35
Dual drive 200K 40 tracks	£329 + VAT	£378.35
Single drive 400K 80 tracks	£239 + VAT	£274.35
Single drive 400K 40 80 tracks switchable	£259 + VAT	£297.85
Dual drive 800K 80 tracks	£449 + VAT	£516.35
Dual drive 800K 40 80 tracks switchable	£469 + VAT	£539.35

✻ COMPLETE WORD PROCESSOR FOR ONLY £1,099 + VAT ✻

This package consists of BBC Microcomputer, View wordprocessor, 400K Slimline disc drive, High resolution 12" Green monitor, Juki 6100 18CPS Daisy Wheel printer and all the necessary cables and documentation. The above package can be supplied with components of your own choice, e.g. 800K disc drive or a different printer. Please phone us for a price for your particular requirement.

Special package deal	£1,099 + VAT	£1,263.85

PROFESSIONAL MONITORS



GREEN MONITORS

12" Green screen monitors with composite and sync. input. Suitable for most computers.

✻ 18 MHz band width, high resolution	£89 + VAT	£102.35
✻ 15 MHz band width, normal resolution	£69 + VAT	£79.35

COLOUR MONITORS

✻ MICROVITEC RGB input 14" monitor supplied with RGB lead for BBC	£209 + VAT	£240.35
✻ SANYO SCM 14" Normal res. 14", 400 dots, RGB input supplied with RGB lead	£199 + VAT	£228.85
✻ SANYO SCM 14M Medium res. 14", 600 dots, RGB input supplied with RGB lead	£299 + VAT	£343.85
✻ SANYO SCM 14H High res. 14", 800 dots, RGB input supplied with RGB lead	£399 + VAT	£458.85

EPSON FOR RELIABILITY

EPSON FX80: 80 column, 160 CPS, normal, italic and elite characters, 256 user definable characters, superscript, subscript, 11 x 9 matrix, bi-directional logic seeking, hi-res bit image printing (960 x 8 dots line), friction and pinfeed, 9 international character sets, Centronic parallel interface.

FX80 PRICE	£349 + VAT = £401.35

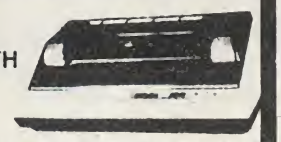
EPSON RX80: 80 column, 100 CPS, normal, italic and elite characters, 11 international character sets, hi-res bit image printing, bi-directional logic seeking, 4 to 10" adjustable pin feed, Centronic parallel interface.

RX80 PRICE	£239 + VAT = £274.84

MX-100, 136 column, 100 CPS, friction and tractor feed, up to 15" adjustable carriage, hi-res bit image printing, true descenders, Centronic parallel interface.

MX-100 PRICE	£399 + VAT = £458.85
RS232 Interface for all above printers	£55 + VAT = £63.25
EPSON RX80FT (friction & tractor)	£269 + VAT = £309.35
FX100	£479 + VAT = £550.85
Roll holder for FX80	£12 + VAT = £13.80
Ribbon for MX80, FX80, RX80	£8 + VAT = £9.70
Ribbon for MX100	£12 + VAT = £13.80

SEIKOSHA DOT MATRIX PRINTERS WITH HIGH-RES GRAPHICS



GP-100A 80 column, 50 CPS, dot addressable hi-res graphics, 10" wide, fully adjustable, tractor feed, 7 x 5 print matrix, Centronic parallel interface.

GP-100A 50CPS PRICE	£175 + VAT = £201.25

GP-250X 80 column, 50 CPS, 10" wide, fully adjustable, tractor feed, true descenders, 64 user definable characters, double height and or double width printing, 8 x 5 print matrix, Centronic parallel and RS232 (serial) interfaces both included.

GP-250X PRICE	£219 + VAT = £251.85

NEW GP-700A 7 COLOUR PRINTER

This latest addition to Seikosha range gives you print in seven colours, 10" wide carriage, friction and tractor feed, 50 CPS print speed, dot addressabe high-res graphics, 4 hammer printing mechanism, 10 CPI or 13.3 CPI, special Quite printing mode, Centronic parallel interface.

GP-700A SPECIAL INTRODUCTORY PRICE	£349 + VAT = £401.35

GUARANTEED LOWEST PRICES

We guarantee that our prices are the lowest on the market. If you can find any item advertised and in stock at less than our price we will match that price.

NEW LOW PRICES ON STAR

ONLY £239 + VAT

The most cost effective quality matrix printers to be launched this year. DP510 and DP515 features include friction and tractor feed and roll holders as standard. 100 CPS print speed, bi-directional logic seeking, 9 x 9 matrix gives true descenders, 2.3K buffer as standard, hi-res bit image plus block graphics, sub and super script, italic printing, auto underlining, vertical and horizontal tabulation, left and right margins set, skip over perforation, back space and self test.

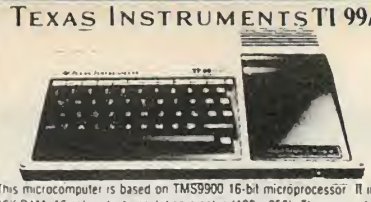
TEXAS INSTRUMENTS TI 99/4A



This microcomputer is based on TMS9900 16-bit microprocessor. It includes 16K RAM, 16 colour high resolution graphic (192 x 256). The screen display is 32 characters, 24 lines TI-BASIC. Full-size keyboard. For Software there are about 1000 programs to choose from. There are a lot of peripherals available, e.g. Disk Drives, Disk Interface, Speech Synthesizer, Extra RAM. Additional Language (PASCAL, TI-LOGO, ASSEMBLER).

TI HOME COMPUTER HARDWARE

Title	Description	Price inc VAT
T199/4A	Complete with UHF modulator and power supply + free cassette lead	£99.95
PERIPHERALS		
Speech Synthesizer	When used with selected modules will roduce electronic speech	£41.95
Peripheral Expansion System	This unit takes all card peripherals and on. internal disk drive	£79.95
Disk Drive – Internal	92K formatted drive, mounts internally in peripheral expansion system	£149.95
Disk Controller Card	Controls up to 3 disk drives, complete with disk manager command module	£109.95
Disk Drive Double Sided	92K formatted capacity per side acts as 2 drives DSK1 & DSK2 total capacity 184K bytes	£219.95
Disk Drive External	Complete with own case, power supply & connecting cables	£259.95
RS232 Expansion Card	Provides 2 serial RS232 ports and one parallel port for interfacing	£79.95
RAM Expansion Card	Adds 32K bytes extra RAM bringing total capacity to 48K bytes	£79.95
P-Code Card	Includes the UCSD PASCAL P-code interpreter	£129.95
Matrix Printer	80 column matrix printer printer GP-100A + cable	£219.95
Matrix Printer GP250X	80 column matrix printer with RS232 and Centronic parallel interface	£273.95
Epson RX80 Printer	80 column, 100 CPS matrix printer.	£297.85

THE AFFORDABLE DAISYWHEEL PRINTER

ONLY £369 + VAT

- ★ 18 CPS – Bi-Directional Logic Seeking
- ★ 10, 12, 15 CPI – Proportional Spacing
- ★ "Drop in" Daisywheel – Triumph Adler Compatible
- ★ Supports all Wordstar features
- ★ Diablo protocols – IBM Selectric ribbon
- ★ 2K Buffer as standard – 100 character Daisywheel

SPECIAL OFFER JUKI 6100 DAISYWHEEL	£369 + VAT = £424.35

THE CP80 QUALITY PRINTER

ONLY £239 + VAT

- ★ 80 CPS – Bi-Directional Logic Seeking 80 Column
- ★ Friction and Adjustible Tractor Feed
- ★ Patented Square Needles up to 9 x 13 matrix
- ★ Hi-Res Graphics and Block Grphics

SHINWA CP80 PRINTER	£239 + VAT = £274.85
SPARE RIBBON FOR CP80	£5 + VAT = £5.75

NEC 8023BE-C PRINTER

This is a high speed printer using bi-directional logic seeking operation. 7 x 9 matrix for alphanumerics, 8 x 8 for graphics and bit image printing. Programmable paper feed, original plus three copies. Greek characters and high resolution graphics. The print quality is exceptional, and the price is affordable.

Price	£299 + VAT = £343.85

★ OKI Microline 80 Printer	£199 + VAT = £228.85
★ OKI Microline 82A Printer	£329 + VAT = £378.35
★ Dragon 32 Computer	£139 + VAT = £159.95

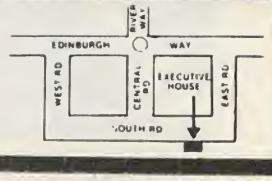
ORDERING INFORMATION

All orders which accompany a cheque, cash or postal orders are *CARRIAGE FREE* (UK only). Please make cheques and postal orders payable to "AKHTER INSTRUMENTS". A carriage charge of 3% of invoice total is applicable to BARCLAYCARD and ACCESS orders. We accept official orders from Government and Educational establishments. We accept VAT FREE EXPORT orders; please phone or write to check shipping cost.

OPENING HOURS: MON-FRI 9am-5.30pm, SAT 10am-2pm.
We welcome callers, no parking problems.



● Circle No. 146

The memory lingers on

Neville Maude makes a date with a combined diary, real-time clock and non-volatile add-on RAM for the BBC Micro.

ONE OF the annoying things about computers is that when the current is switched off everything held in memory is lost. Files can be saved to tape or disc, of course, but they then have to be fed back in on each occasion. The idea behind the Acacia non-volatile real-time clock and RAM system for the BBC Micro is to store diary information in RAM which has its own back-up battery.

The Acacia unit is housed in a substantial case which measures 8in. by 5.5in. by 3in. A ribbon cable links it to the micro's 1MHz bus connector, and a four-strand connector goes to the auxiliary power socket.

The all-important back-up power is supplied by a Tadrian TL-5104P lithium battery. Acacia quotes a rather conservative three-year battery life, after which a replacement will cost around £5. New batteries can be inserted by anyone who can handle a soldering iron without damaging CMOS components, and Acacia will do the job for those who lack the courage to do it themselves.

Sideways ROM

Interfacing software comes on a ROM which should be placed in the first socket from the right. It is formatted as sideways ROM so only 256 bytes of workspace are needed. The current version is compatible with Torch, second processors and so on.

The RAM filing system is very swift indeed — three times faster than disc for Load and Save. It is also very reliable since there are no moving parts, and operation is completely silent. Time and date can be automatically included into files.

Setting up

Only 4K of memory is available, but that is enough to be useful for small things such as setting-up data. For example, if using the Wordwise word-processor chip it is useful to let the non-volatile RAM feed in things like *TV255,0 and *FX6,0. Other useful instructions might set the second values for the user-definable keys to provide single-key controls, standard page settings, and any commands required to ensure that the printer produces a £ sign instead of a #.

The idea of instantaneously switching in Snapper, Planetoids or more serious long programs must wait until more RAM is available. Acacia can provide a 26K upgrade with no change in base software, though this costs about £150 extra. When 8K chips become cheap enough to replace the present chips, full expansion will be possible up to 64K.

The diary system is based on a real-time clock which can provide readings of the year, month, date, hour and minute. Reminder messages are available if required; they could be yearly for birthdays or an approaching MOT test, or monthly, like cheque-card repayments. Temporary messages for things like switching off the cooker can be programmed in. An alarm can be made to sound even if you are in the middle of another program. The current version holds dates up to the year 2014.

You can search the diary for particular entries. Suppose you were a keen golf player, entering

*DIAK GOLF

would select and display all entries showing this keyword. If you wanted to know when you met Mr Brown the computer would pick the relevant entry or entries. Useful refinements are that upper and lower case can be used. There is a wild-card facility so if you are not sure whether the name is spelt with an e or not, typing

Brown*

would cover both contingencies.

Apple Diary

The Oasis Diary Card provides a clock/calendar for the Apple II computer. The software, in ROM, provides commands to create, review, search and exit from the diary information, which is held in battery-backed RAM. Data retention is stated to be a minimum of five years. The 16K of RAM allows about 240 diary entries, but a factory upgrade to 64K of RAM is possible. The diary card can be installed in any slot except slot 0, and the diary can be accessed without disturbing any program in RAM. Contact Oasis Electronics Ltd, University Village, Norwich NR4 7TJ. Telephone: Norwich (0603) 503275.

*DIAA—add a reminder to diary
*DIAD—display and/or delete all reminders for specific or subsequent dates
*DIAK—display and/cr delete items containing keyword
*DIAR—read and/or delete items that activated alarm
*TIME—enable continuous date and time display
*DATD—display non-continuous time and date
*TIMD—disable continuous time and date display
*TIMS—set the time
*DATS—set the date

Table 1. Diary system commands.

*ACCESS—locks or unlocks file
*INFO—determines load address, length, and execution address file
*OPT 4n—controls autoboot, 1 Load, 2 Run, 3 Execute
*EXEC—treats file as if typed in
*SPOOL—directs output to screen, printer, RS-423 etc
*RAM—access to Acacia filing system

Table 2. Filing system commands.

Conclusions

● The diary and RAM filing system are a very clever piece of programming, with well thought-out commands.

● A commendably clear 36-page A5 manual is supplied.

● The instant loading offered by non-volatile RAM storage is attractive, but the standard 4K is large enough only for frequently used set-up routines rather than full programs.

● Good old-fashioned desk diaries and real-time clocks with built-in alarms can both be had for a few pounds: whether a micro-based version of the same things is worth 10 times as much must be a matter of personal priorities.

● The Acacia Diary and RAM filing system is supplied by Acacia Computers Ltd, 5 Coombe Lea, Bickley, Bromley, Kent BR1 2HQ. It costs £147 including VAT; the 26K RAM upgrade costs about £150.

VISI ON

Ian Stobie looks at Visicorp's long-awaited mouse-controlled integrated software system: how it compares to the Lisa and to competing products promised by Digital Research and Microsoft.

A YEAR AFTER the Apple Lisa pioneered a new approach to software the first of the major imitators has arrived. Visi On from Visicorp has, like Lisa, a friendly mouse-controlled user interface. Also like Lisa, Visi On lets you run several applications concurrently, displaying them in separate windows on the screen, and it lets you pass data between them.

Unlike Lisa, Visi On does not require special dedicated hardware — it will run on a range of machines. But it is not an operating system, but an "operating environment". You load it on top of your operating system, which is one reason why it is machine independent. The initial version, available immediately, is for the IBM PC XT.

Visi On comes in two parts. The Visi On Applications Manager sits immediately on top of the OS, which in the initial release is MS-DOS. The VAM seizes control of all interaction between the machine and the user, doing things like displaying the output from application programs in user-defined windows on the screen and accepting commands entered using the mouse or keyboard. Visi On application programs then sit on top of the Applications Manager.

Initially Visicorp is releasing three application programs for Visi On: a spreadsheet, a word processor and a graphics package. They are called Visi On Calc, Visi On Word and Visi On Graph, names which are sure to lead to confusion with Visicorp's older series of programs, the VisiCalc/VisiWord/VisiPlot range. The company intends to bring out other Visi On applications, with a database called Visi On Query to be followed by mainframe-to-micro communications.

Data transfer

Data from the Visi On programs can be transferred from one program to another, from Calc to Graph to produce a bar chart for instance, and then from Graph to Word to incorporate the bar chart in a report. At least that is the intention. In fact the initial release, Version 1.0, that I saw running on the IBM could not manage to move charts across into a Word document.

It took Apple some time to get similar functions working on the Lisa, but with a year's start the Lisa provides a more completely data-integrated invironment. On the other hand Visi On's response time seems good compared to the sluggish standard set by the Apple Lisa, especially when opening up an additional window for a new application program.

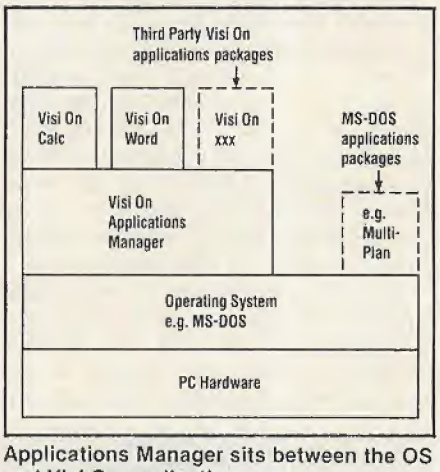
The mouse supplied by Visicorp has two buttons and is of novel design. Instead of having a large ball-bearing in the base like the Lisa and Microsoft mice, underneath it has a light emitter and a light detector. You move the mouse about on a 9in.-by-6in. flat mirror with a grid marked on it. This optical system seems to work reasonably well and is claimed to be more reliable. Visicorp says later versions of Visi On will support other manufacturers' mice.

The general approach embodied in both Visi On and Lisa is to simulate the familiar desk-top paper environment on the computer screen. I personally find this makes unfamiliar packages easier to use. The consistency between applications makes it easier to remember what to do when you return to a package after not using it for several weeks.

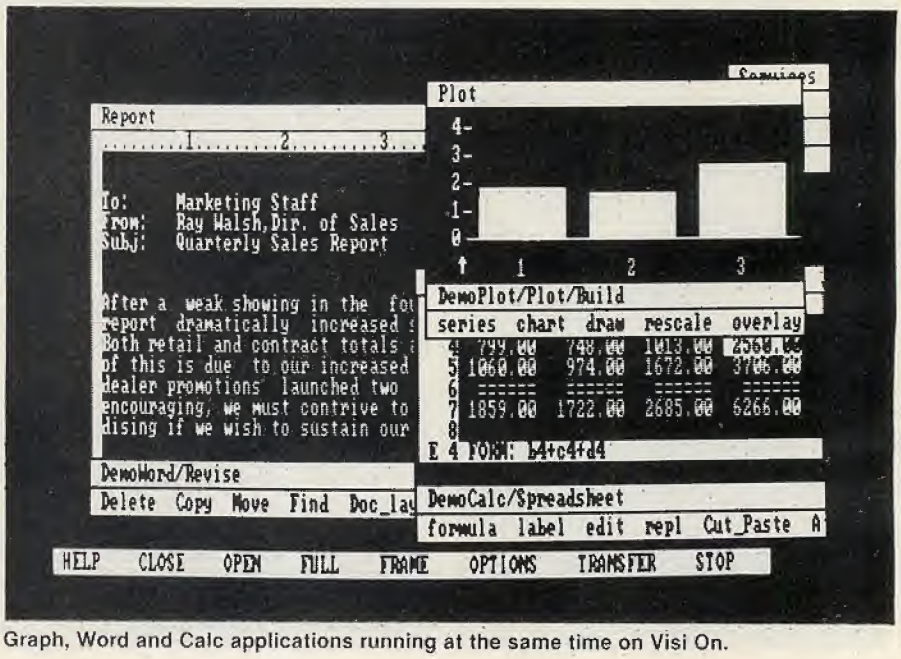
All the same, I find it difficult to be very excited by Visi On, perhaps because it is so very like the Lisa. Where Visi On differs from the Lisa it is generally less ambitious. It does not make such extensive use of graphic symbols on the screen for instance, being content with displaying keywords.

As with Lisa, the problem most people find with Visi On is the price. Before you can do anything you need the Visi On Applications Manager costing £375 and the mouse at £185. The Visi On applications themselves cost an additional £295 for Visi On Calc, £285 for Visi On Word and £195 for Visi On Graph. When you add on the cost of an IBM PC XT you are not far off the price of Lisa, which is £6,500 with all six integrated Lisa applications.

Visi On will be launched for several other machines including the Texas Professional, the Wang PC and the standard IBM PC, but the overall cost is unlikely to be much lower because Visi On requires a hard disc. The VAP code alone takes up 1.5Mbyte. It is crucial to the success of Visicorp's strategy for Visi On to get third-party suppliers writing independent application packages for Visi On. Above all, Visicorp has to achieve a large installed base quickly. So the all-in end-user system price matters a great deal.



Applications Manager sits between the OS and Visi On applications.



Graph, Word and Calc applications running at the same time on Visi On.

To encourage third-party suppliers to develop Visi On application programs Visicorp is releasing full details of the VAP's program-level interface. This is not as useful as it sounds, as Visi On applications will have to be written in C and you will need the Visi On toolkit to build mouse control and windows into your application package.

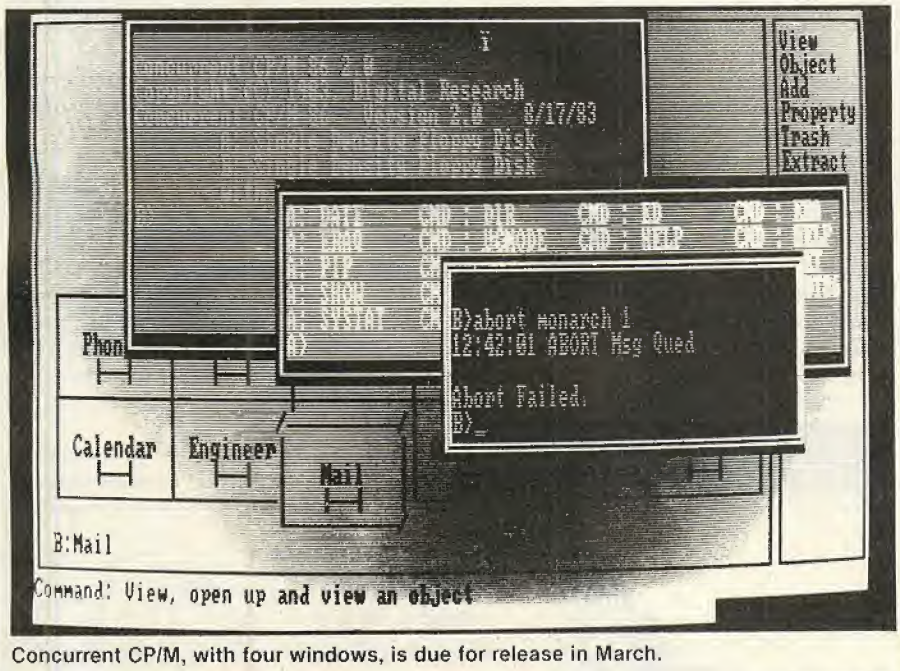
The toolkit will run only in a Unix environment at the moment, which means that whatever your target machine is you will need a Vax or a good 68000-based machine to develop your software on. Further, the Visi On toolkit is expensive: the Vax version costs £7,500, and the 68000 version £5,000. A version of the toolkit to run on the IBM PC, which presumably will be cheaper, is promised for early 1984.

Since Visi On sits on top of a standard operating system running on a standard machine, the key question for any commercial software developer is why not simply write directly for the OS. Immediately this would open up the huge potential market of possibly one million MS-DOS systems already out there, compared to an installed user base for Visi On, at the time of writing, of zero.

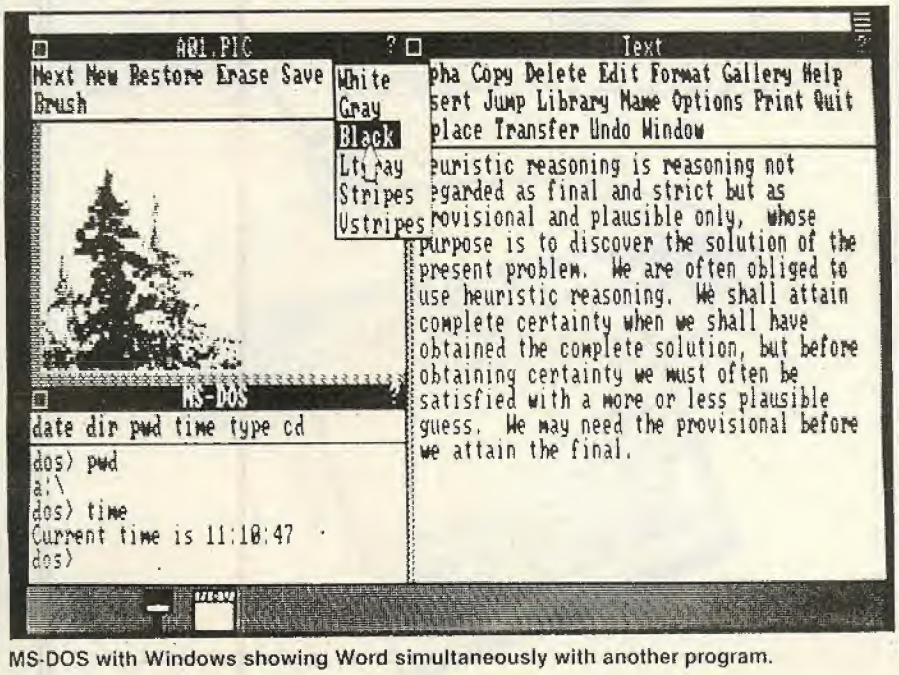
It could be argued that it might make better commercial sense to write your own set of routines and put them in with the application code, like in Lotus 1-2-3 or Multiplan for example, or to forget about such frills altogether. This assumes that the standard operating systems are going to remain simple, with a fairly spartan user interface. What is happening is that both Microsoft and Digital Research are putting elaborate user-friendly features into their OSs, and are bringing out powerful software tools to help with system development. Now both have announced concurrent windowing for future products.

At a press conference timed to the hour to match Visi On's launch, Microsoft showed Windows, or rather an early mock-up version. The real product will, it is claimed, be available in April 1984. A year ago Visicorp pre-announced Visi On to journalists at the height of the excitement over the Lisa. It is ironic that in this instance Visicorp is having its thunder stolen in the same way.

Windows is really part of MS-DOS 2, the latest release of Microsoft's 16-bit OS. Windows is still a provisional product, but the demo I saw running on a DEC Rainbow 100+, the new hard-disc Rainbow, looked very good. It has better-resolution graphics than Visi On and made full use of Lisa-style icons. However, the response time of the eventual product was impossible to judge given the artificiality of the demonstration.



Concurrent CP/M, with four windows, is due for release in March.



MS-DOS with Windows showing Word simultaneously with another program.

Less ambitious

Microsoft's MS-DOS 2 with Windows is a less ambitious product than Visi On in that it looks as though it will not have virtual-memory management. this suggests that the number of tasks you can do concurrently may be more limited, or the response time may suffer in some circumstances. Nonetheless I would judge it to be a real threat to Visi On in the market place. Already Microsoft has signed deals with 23 computer manufacturers to put MS-DOS with Windows on their machines. As an OEM product MS-DOS with Windows will sell in volume to system suppliers. To the end-user it will appear to be come free with the system. Visi On, on the other hand, has to be bought like any other application product, and it is not cheap.

Microsoft's activities will have the most immediate impact on Visicorp because all the early versions of Visi On will be for MS-DOS machines. But Visicorp intends to release Visi On for Digital Research operating systems at some stage. Again, Digital Research has rapidly followed the Visi On launch with an announcement of its own. Version 3.1 of Concurrent CP/M-86, due for release in March, is to have windows. DR's windowing facilities are limited to four windows active at one time, but there will be support for data transfer between windows, which is probably more important.

Between them, Digital Research and Microsoft have not left Visicorp much time to start an unstoppable Visi On bandwagon rolling. And then there is Apple, pioneer of the mouse/windows/integrated-software approach. Is it content to let things rest with the Lisa? In next month's *Practical Computing* we reveal the shape of Apple's answer.

Visi On's U.K. distributor is Rapid Terminals, Rapid House, Denmark Street, High Wycombe, Buckinghamshire HP11 2ER. Telephone: (0494) 26271. ■

The best policy

Ian Hopkins details the crucial clauses to look out for when you are insuring a micro

THE MAGIC of the micro is great to begin with. It obediently displays the latest profit figures, the answers to homework or the latest state of your single-handed battle to save the world from extra-terrestrial invasion. However, as with the TV and the hi-fi, at some point things are liable to go wrong.

It may be that a fault develops in the mysterious little box, or the keyboard refuses to function. Maybe your Dragon ends up in a burglar's swag-bag while you are at Butlins, or the ZX-81 loses an argument with the vacuum cleaner. As with most of the little tragedies of life, however, some solace can be found if you plan in advance — and take out insurance.

It is possible to insure practically anything in which you have a financial interest, but the insurance companies have been slow to adapt to computers, compared with their obsession for cars, houses and lives. At first they were happy to insure micros, and even larger machines, as an item in a business-contents contract, or to add the personal micro to the list of other electrical gadgets among the personal effects covered by a house-contents policy.

Embarassment

It has taken some time for the companies to realise the special problems relating to computers and to see that these are risks of a different nature than those applicable to the washing machine. It is still normal to go to a broker or the local branch office of a major company and be met with an embarrassed stare when you enquire about micro insurance.

There are three ways of approaching the insurance of your micro, and each has advantages and disadvantages. The simplest is to add it to the appropriate section of an office or house-contents policy, usually on an "all risks" basis. For home computers this involves simply contacting your insurers and asking them to add the machine to your policy and informing them of its value. The annual premium is then likely to be adjusted to take it into account.

Premiums are usually calculated as so many pence per £100 insured. Rates vary not only from company to company but from area to area. Norwich Union, for example, would ask 35p per £100 in low-risk country areas but as much as 90p per £100 in the burglar-infested wastes of inner London. Provincial's asking rate is £1 per £100. However, the cheapest policy is not alway the best since exclusions and excess — the sum you remain liable for, such as the first £100 of each claim — vary from company to company.

The problem with this type of insurance for a micro is that while it is cheap it only covers normal risks such as fire, theft and, to quote the Provincial, "loss or damage by any accident or misfortune". It does not cope with cooked chips or head crashes, still less with any financial loss which you incur because the machine is out of action. It may, however, be the economical choice for casual home users or smaller businesses.

A growing number of companies now produce computer policies that will cover the specific needs of small machines. For example, in addition to fire, theft and accident cover they will give protection for data media, costs of replacing data on tape or disc and similar expenses. Some of these companies are small engineering subsidiaries of the larger ones. For example, British Engine belongs to the Royal Insurance Group, National Vulcan is associated with Sun Alliance, and Scottish Boiler is part of General Accident. They tend to concentrate on commercial installations, especially mainframe computers, but will also cover micros. British Engine has a special Mini and Micro policy. Other companies catering specially for computers include household names such as Cornhill, Commercial Union and Eagle Star, while Prudential and Norwich Union have still to wake up to the potential in computer insurance.

Dr Ian Hopkins is a Director of Kosmos Computing

What these companies offer varies in detail but there are a large number of similarities. The significant differences are often simply the cost of premiums and the excess imposed. In the event of theft or total loss by fire or damage, most companies will replace the machine with a new one of the same specification. This new-for-old approach is important for computers because of the poor state of the second-hand market.

In motor insurance it is normal to indemnify the customer. In other words, if

your four-year-old Cortina is hit by a runaway lamp post you get the value of a four-year-old Cortina — no more, no less. You could then go out and buy one if you wanted to replace like with like. However, it is not so easy to get an Acorn Atom or Pet of a particular vintage. By and large the insurance companies recognise this, though there are a few exceptions, such as Guardian Royal Exchange. Many companies limit new-for-old to fairly recent models.

Along with the loss of the machine, loss of tapes and discs is an important risk, especially if they are carried about or lent to other people. Most of the specialist policies make some attempt to finance the resurrection of software. Some do not compensate for loss of the actual media, and the degree to which they will support data recovery also varies. Commercial Union is more generous on this than many others but it is important to get a clear understanding of the extent of compensation before you go ahead and sign the agreement.

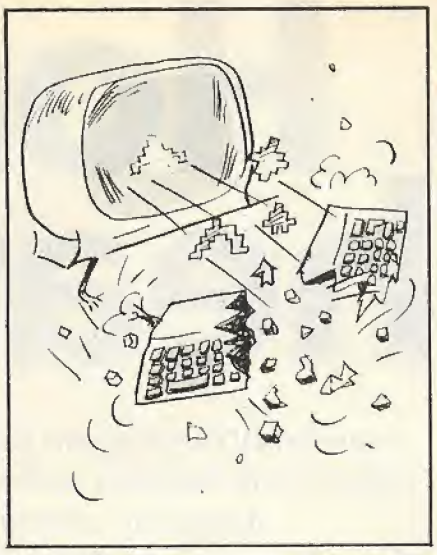
Consequential loss

A third important area of cover is what is known as consequential loss. It covers loss of income and other costs resulting from computer breakdown or loss of access to the machine. British Engine summarises this cover as "additional expenditure up to the limit of the sum insured, incurred in order to continue the work normally done on the computer for up to six months . . .".

It is in the area of consequential loss that the traditional home-contents policies fall down because they will not offer any compensation for this type of loss. Office policies tend to include some cover of this nature often designated "interruption of work", although it may not be adequate for the potential loss of a database or large software system. The average home-computer owner, of course, may suffer little or no real loss of earnings if the micro is used solely for entertainment or pleasure. An identical machine used as the heart of a business-accounts or customer-record system could lead to financial problems in the event of theft or damage.

All risks?

If you are considering a so-called all-risks policy it is important to remember that it does not in fact cover literally all risks. There are a number of exclusions, which vary from company to company, but again they show a fair amount of common ground. Most policies exclude problems resulting from wear and tear and especially "derangement", by which is meant breakdown resulting from loose connections rather than a faulty part. Nearly all policies exclude loss or damage following "war, riots and civil commotion" and there are particular limitations in Northern Ireland. The effects



of nuclear radiation and changes in atmospheric pressure changes, such as sonic booms, are also excluded from nearly all policies. If your micro is insured on the basis of home use only you may have difficulties with a claim arising from business use. Domestic and General is especially keen on this point.

Failure of the electricity supply is often excluded, except for long periods, and this is a vital element in computer stoppage. For example, British Engine only insures against failure of supply for more than four hours and excludes "deliberate acts of the supply authority or drought". Eagle Star has a more complicated power-failure clause, but Commercial does not exclude this problem.

As with all insurance policies, there are excess clauses. You are expected to pay the first £10 per claim with Commercial Union and Cornhill, up to £50 per claim with Scottish Boiler.

Special policies

Finally, there are special contracts for certain models. Domestic & General produces policies geared to the Genie, Vic-20 and Commodore 64, and also insures the computer trade. Another type of special policy is the computer-fraud contract of Legal and General, but this is more likely to interest larger financial businesses than the owners of micro systems.

The cost of specialist computer policies varies from about £8 upwards, and depends on the value of the equipment covered and the potential loss of business. The average home or small-business user always needs to consider carefully the cost of a special policy compared with an extension to a home/office-contents contract. The decision really hinges on whether serious problems would emerge if the machine were to be out of action for more than a few days.

A final type of cover deals with the exclusions of wear and tear and derangement found in most regular policies. Many micro users, especially those with business interests, find the insurance companies' exclusions irritating. As far as they are concerned, if the machine is down they want it put right as quickly and as economically as possible, whatever the cause. The traditional answer to this problem has always been a maintenance agreement of a similar nature to that which many of us have to look after our central heating. For an annual fee, an engineering company will agree to service the equipment free of labour and we just have to pay for the parts.

Datacover

However, computer users now have an alternative which is growing rapidly in popularity. It is known as Datacover and is organised by the Bristol firm of insurance brokers, Halsey and Company. Its distinctive feature is breakdown cover. The Datacover policy includes parts as well as labour on an all-risks basis, and expenses of recompiling data, hiring alternative equipment and normal loss or damage are included. The idea is that the average computer user needs a policy which really covers all insurable risks and is simple to claim on. Datacover is cheaper than a maintenance agreement, and the user has the freedom to contact any engineer and then present the bill to the insurers.

Critics of Datacover argue that maintenance agreements ensure that the engineer places the contracted customer high on the priority list. In other words if you ring XYZ Engineers Ltd when your machine is down someone will come today if you have a maintenance contract but you will have to wait till next week if you use Datacover. There is some doubt, however, whether things are really quite as bad as this. Surely, where there is competition between engineering firms there is ample incentive to deal with all customers promptly. The Datacover concept looks like catching on and represents a very good deal.

There are few professional advisers who can offer help in choosing a policy to insure a micro. On the whole, if a machine is being used for personal use then an extension to a home-contents all-risks policy may be adequate unless a lot of software is being produced. If the micro is being used regularly for personal or business purposes and any breakdown would be costly or inconvenient, then Datacover may well be the answer. For firms which can do their own maintenance or the individual who enjoys soldering PCBs a normal special computer policy may be enough.

As with all insurance policies it pays to get what advice you can and to read the small print. What are the exclusions? Does it cover transit? How much consequential loss is covered? The day when the micro can be insured as easily as the car may be some way off, but a little shopping around should produce a suitable policy for home and business users.

Home heating

John Smith's program takes the hard labour out of calculating radiator sizes and the boiler rating for a domestic central-heating system.

A WELL THUMBED book of tables is an indispensable part of most central-heating engineers' equipment. The vital information it contains includes data on the heat output of radiators of a given size, water flow in the pipes, boiler sizing and plenty more besides. A rough-and-ready convertor specifying what size of radiator is required for a room of a particular size is likely to be particularly well used.

However, an efficient system calls for some extensive calculations to make sure that fuel is not wasted in overheating some rooms while others remain chilly. In the first place you need to work out precisely how much heat is required in each room. The inside and outside temperatures, the volume of the room and how often the air in the room is changed are the most crucial factors. The area of glass in the room, the temperature of the house next door and the insulating properties of various building materials also need to be taken into account. It all amounts to quite an involved series of calculations which must be repeated for each room in the house.

If you have ever done the exercise for yourself the thought is bound to have dawned that this is work more suited to a computer than a human. With this program you can repeat the calculations for a series of external temperatures and compare the results. A bonus is that any errors in your raw data can easily be corrected without having to spend hours checking the knock-on effect in other rooms: you just run the program again.

Making changes

The program makes it particularly easy to change the target temperature in any room. Other parameters can be altered by changing the appropriate program line. Likely candidates are: number of rooms, variable name Nrooms% at line 120; external temperature, variable name Outside at line 100; and the temperature in adjoining building: variable name Ndoor at line 110.

The data itself is placed in Data statements. It is not worth using a data file if you just want to run the program a few times. If you need to run the program regularly you can modify it to read from such a Data file; the data is simply loaded into anarray for analysis in lines 180 to 220.

The program assumes that each room has six rectangular surfaces, so lighthouse-keepers will have to make approximations. Only one window is allowed for in each wall, but you can aggregate the areas of several windows. No allowance is made for internal doors; errors arising from this assumption are negligible as it is bad practice to design for large temperature differences across internal walls. External doors present a slightly different problem, which can best be dealt with by adding a few tens of watts to the heating requirements of the room in question.

The program calculates the heat loss and ventilation loss for each room. The heat-loss calculation uses the general formula:

Heat loss = area of surface × U value of surface × temperature difference across surface

where area is in square metres, the temperature in °C and the heat loss is in watts. In each surface a separate calculation is done for the window area and non-window area.

Ventilation loss is calculated from the formula:

Ventilation loss per room = number of air

changes per hour × volume of room × specific heat capacity of air × temperature different to outside.

The boiler losses are simply estimated as being 10 percent of the total losses so far. An additional 3kW is then added for domestic hot-water requirements to arrive at a total figure for the minimum boiler capacity needed. A conversion factor is applied to give results in BTU per hour, as manufacturers still quote radiator and boiler outputs in these units.

Before entering the data, draw a rough plan of each floor of the building. Label each room with a unique identification number, starting at −1 and going on to −2, −3, etc.; this number corresponds to program variable RoomID. Mark the desired temperature in each room in °C. Then draw up a table with the dimensions in metres of each room and, where appropriate, the size of the windows. Assume one wall to be north and then work round east, south and west, which is a help when checking the data afterwards.

The program expects data in the following order: RoomID; temperature; x_{surf}, y_{surf}, U_{surf}, $xglass_{surf}$, $yglass_{surf}$, $Uglass_{surf}$, Tag — repeated for each of the six surfaces; x,y,z — dimensions of room in metres; number of air changes per hour. This makes a total of 48 items of data, which you repeat for each room followed by the value 10000 as the last data item as an end-of-file marker. There is considerable redundancy in the data, but the format is convenient and quick to enter, and simplifies the program as each room is represented by a record of fixed length. The Tag variable must be one of the following:

—the absolute value of the RoomID of the room adjoining this surface;
—999 if the surface is an outside wall;
—1000 if surface adjoins other building.

The Tag is the key to the operation of the program. The temperature difference across each surface is required to calculate the losses, and the program picks up a Tag and scans the entire data looking for a RoomID corresponding to it. RoomIDs are negative and so can be easily extracted from

CENTRAL HEATING PROGRAM 'HEAT'
   BY John Smith. (C) 1983
-----------------------------------
!   Lowest outside temp assumed = -1 !
!   Temp   next door is assumed = 12 !
-----------------+-----------------

Living room: Desired temp = 22
Surface 1 Loss = 1947 Btu/hr
Surface 2 Loss = 435 Btu/hr
Surface 3 Loss = 139 Btu/hr
Surface 4 Loss = 725 Btu/hr
Surface 5 Loss = 1137 Btu/hr
Surface 6 Loss = 71 Btu/hr

Ventilation loss = 1759 Btu/hr

Radiator needed =              6217 Btu/hr

****

Lounge: Desired temp = 20
Surface 1 Loss = -140 Btu/hr
Surface 2 Loss = 302 Btu/hr
Surface 3 Loss = 2252 Btu/hr
Surface 4 Loss = 604 Btu/hr
Surface 5 Loss = 1080 Btu/hr
Surface 6 Loss = 0 Btu/hr

Ventilation loss = 1671 Btu/hr

Radiator needed =              5771 Btu/hr

****

Kitchen: Desired temp = 16
Surface 1 Loss = 981 Btu/hr
Surface 2 Loss = 1295 Btu/hr
Surface 3 Loss = 0 Btu/hr
Surface 4 Loss = -471 Btu/hr
Surface 5 Loss = 538 Btu/hr
Surface 6 Loss = -139 Btu/hr

Ventilation loss = 1249 Btu/hr

Radiator needed =              3456 Btu/hr

****

Lower hall: Desired temp = 16
Surface 1 Loss = 0 Btu/hr
Surface 2 Loss = 1051 Btu/hr
Surface 3 Loss = 1576 Btu/hr
Surface 4 Loss = -326 Btu/hr
Surface 5 Loss = 558 Btu/hr
Surface 6 Loss = 0 Btu/hr

Ventilation loss = 648 Btu/hr

Radiator needed =              3509 Btu/hr

****

Rear bedroom: Desired temp = 21
Surface 1 Loss = 1818 Btu/hr
Surface 2 Loss = 148 Btu/hr
Surface 3 Loss = 71 Btu/hr
Surface 4 Loss = 670 Btu/hr
Surface 5 Loss = -54 Btu/hr
Surface 6 Loss = 494 Btu/hr

Ventilation loss = 1295 Btu/hr

Radiator needed =              4445 Btu/hr

****

Front bedroom: Desired temp = 20
Surface 1 Loss = -72 Btu/hr
Surface 2 Loss = -78 Btu/hr
Surface 3 Loss = 2281 Btu/hr
Surface 4 Loss = 620 Btu/hr
Surface 5 Loss = 0 Btu/hr
Surface 6 Loss = 491 Btu/hr

Ventilation loss = 1286 Btu/hr

Radiator needed =              4530 Btu/hr

****

Small bedroom: Desired temp = 21
Surface 1 Loss = 212 Btu/hr
Surface 2 Loss = 656 Btu/hr
Surface 3 Loss = 987 Btu/hr
Surface 4 Loss = 39 Btu/hr
Surface 5 Loss = 84 Btu/hr
Surface 6 Loss = 154 Btu/hr

Ventilation loss = 404 Btu/hr

Radiator needed =              2539 Btu/hr

****

Upper hall: Desired temp = 16
Surface 1 Loss = -128 Btu/hr
Surface 2 Loss = 1231 Btu/hr
Surface 3 Loss = -213 Btu/hr
Surface 4 Loss = -205 Btu/hr
Surface 5 Loss = 0 Btu/hr
Surface 6 Loss = 155 Btu/hr

Ventilation loss = 407 Btu/hr

Radiator needed =              1249 Btu/hr

****

Bathroom: Desired temp = 19
Surface 1 Loss = 822 Btu/hr
Surface 2 Loss = 963 Btu/hr
Surface 3 Loss = 127 Btu/hr
Surface 4 Loss = -127 Btu/hr
Surface 5 Loss = 81 Btu/hr
Surface 6 Loss = 226 Btu/hr

Ventilation loss = 792 Btu/hr

Radiator needed =              2888 Btu/hr

****

        Sum of losses so far = 34607 Btu/hr

        Add 10% for the boiler losses:

        this makes the losses up to 38068 Btu/hr

        Now allowing 10000 Btu/hr for domestic  hot water,

        boiler capacity must be at least =          48068 Btu/hr (14083 Watts)
```

(continued from previous page)

the data; the program just multiplies the Tag by −1 before beginning its search for a RoomID. When the program finds a RoomID which corresponds to the Tag, the temperature in that room is simply the entry following that RoomID in the array.

In the example for which data is given, the hall was treated as two rooms, as the geometry of the building lent itself to that approach; remember to add one to Nrooms% if you do this. Changes should be made to the procedure in lines 1070 to 1150 to associate the RoomID with the name of the room for your application.

The program runs on the BBC Microcomputer Model B in Mode 6; change line 10 to read Mode 7 to run on a Model A. It takes about a minute to compute the results for a whole house and output can be sent to a printer as one of the options. Page mode is engaged when output goes only to the screen, and is disengaged for printer output.

LOVE STORY

"Gordon Baker had often thought about buying a computer, but his courage always failed him at the vital moment. "I'm not a technical man", he explained. "I need patience and understanding and when I saw Columbia in a recent issue of a computer magazine, it looked so attractive and uncomplicated that I just had to send for more details."

A package arrived from Icarus the following Monday. With trembling hands Gordon opened it and read through the letter and introductory brochure. It seemed too good to be true: Columbia embodied all that had been missing from his previous relationships.

A meeting was arranged.

Gordon passed that afternoon with his local Icarus dealer in a state of near ecstasy! Columbia was not only attractive to look at, but, as the dealer explained and demonstrated, proved extremely competent without being overly complicated.

Soon after that initial contact Gordon had to fly North on business and it was a fortnight before he could contact the dealer to fix another meeting. It was decided to bring Columbia round to Gordon's office to be introduced to the staff. It was vital to establish as soon as possible whether Columbia could operate efficiently in his own business environment.

Things could not have gone better. Columbia was a big hit with everybody; Accounts, Stock Control, Sales, Research and Forecasting were all of one accord: Columbia was terrific.

They enthused over the high resolution amber screen, were effusive about the choice of CP/M 86 and MS-DOS operating systems and IBM PC compatibility, and then became quite emotional over Columbia's floppy and Winchester disc configurations, its expandability up to 896K RAM and the access it gave to hundreds of 16 BIT 'off the shelf' software packages.

The dealer asked Gordon if he would like to see Columbia again. "Oh, please", said Gordon, "could it stay for just a couple more days?"

Within a week Columbia had moved in permanently, and Gordon was on top of the world.

"I'd just about given up hope of ever finding my perfect partner", he said, "until Columbia came along and changed my life!"

In the background, the warm glow from the amber screen seemed to indicate that Columbia too was well pleased with the situation . . ."

If you think the Columbia PC could be your perfect partner too, we'll be pleased to send you more intimate details in complete confidence.

The Columbia 16 BIT Columbia Your perfect partner Personal Computer

Apple operations

Peter and Owen Benson set up the Apple II as a process controller.

THE GATEWAY between your Apple II and the big, wide world outside is that little socket which has so far been monopolised by the game paddle and joystick. An A/D converter is built into the Apple, so analogue signals received through the games port can be converted into digital form. They can then be stored or manipulated by the computer.

The essential component of a games paddle is a variable resistor or potentiometer, the value of which depends on the position of the paddle knob. When reading the games port the Apple checks the current value of the potentiometer by measuring how long it takes to charge an internal capacitor through it. The value produced is a number between 0 and 255, corresponding to resistances in the range zero to 150kΩ.

Suppose games paddle 0 is in the middle of its travel, and you enter the instruction

```
PRINT PDL (0)
```

The number 127 appears on the screen. If you were playing a game, the value of the paddle setting would not be printed, but would be used to provide instructions as to how to move something on the screen.

The Apple obviously has no means of knowing what kind of resistor is connected to the Game I/O socket so any resistive devices can be used instead of a paddle. There are a huge variety available, but one of the simplest is a thermistor, which is just a resistor that changes its value according to its temperature. Thermistors can be bought for a few pence from electronics stores, Tandy shops, etc.

Clearly a thermistor can be used to enable the Apple to measure temperatures, then graph them, manipulate them or store them. These values can even be used as triggers to instruct the computer to switch heaters, fans or warning devices on and off.

Listing 1 shows a program to take temperature readings each minute and graph the results.

As written, the program produces results in arbitrary units. To give temperatures in conventional units such as °C or °F you have to calibrate the thermistor. The first problem is that thermistors come in a variety of types. For example, some increase in resistance as the temperature rises, while others decrease. Either type will do. The next variable is the thermistor's resistance. It is probably best to choose one with a resistance between 60kΩ and 100kΩ, since this is near the middle point of the Apple's measuring capacity.

To calibrate the thermistor, place it in crushed, melting ice to find its resistance at 0°C, and then next to a household thermometer under a lamp or other heat source. Allow a few minutes for the temperature to stabilise in each case.

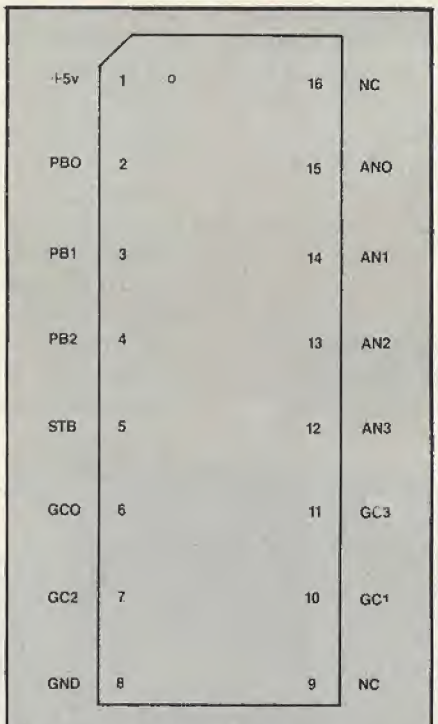
The Apple has provision for four games paddles, so it can handle up to four separate thermistors at once, which are read by PDL (0), (1), (2) and (3). Data from two sensors could be used to monitor outside and inside temperatures, or two chemical baths in a dark-room, and control heaters accordingly.

You can do a similar sort of thing with other resistive devices. A light-dependent resistor, LDR, can be bought from Tandy for about £1. As the name implies, the value of the resistor depends on the amount of light striking it, so you could use it to monitor light levels, compare the output of supposedly similar light bulbs, or control operations in the dark-room.

An LDR can be used to count the number of times a light beam is interrupted, since the resistance suddenly changes when the light is blocked. A limiting factor here is that the LDR does not respond instantly, so it can only be used for events happening less frequently than about 100 times per minute.

You can use a set-up of this kind in the physics lab to measure the speed of a moving cart. The computer starts counting when the beam is first interrupted, and stops when the beam is reinstated. By converting the count value into seconds and dividing the length of the vehicle by the calculated time you obtain a very useful value for its speed. Only one LDR is needed, and the light source can be daylight from a window. If possible, choose an LDR with a resistance of about 80kΩ, so that it normally lies near the middle of the Apple's measuring range.

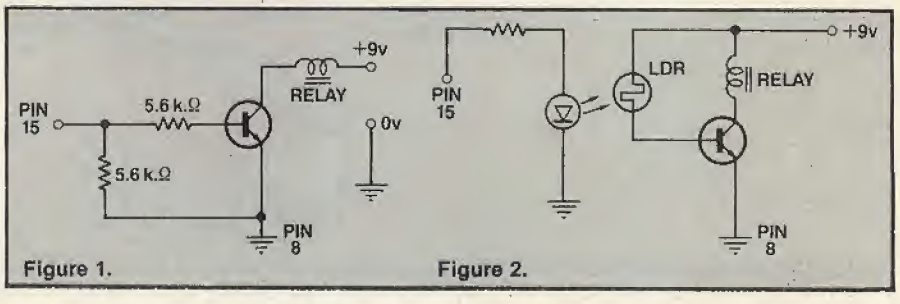
The LDR is also the key to measuring other factors, which are not in themselves variable resistances. For instance, a voltage



Pin 1 — +5V at up to 100mA
Pins 2 to 4 — used for the push buttons
Pins 6, 7, 10, 11 — used for the paddles
Pin 8 — electrical earth
Pins 12 to 15 — annunciator outputs, up to 10mA

The connector plugs in with pin 1 towards the front of the Apple.

Figure 3. Game I/O connector.



Peter Benson is director of studies at Aiglon College, Switzerland.

or current to be monitored can be used to operate a light bulb or LED which shines directly on to the LDR. If screened from the ambient light — you can use a plastic 35mm. film canister — the resistance of the LDR will vary with the changing voltage or current, allowing the computer to track it. The values will not be known directly, but this is often not necessary.

It is almost as easy for the Apple to control external electrical devices as it is for it to receive data. By arranging for it to do both, the computer can be used to run a sophisticated control system.

The Game I/O socket includes four outputs, known as annunciators, which can be turned on or off by software. They are labelled AN(0) - (3). The voltage level at these outputs is normally close to zero, but when they are turned on the voltage is set to +5V. Suitably buffered for the safety of your computer, this change can be used to turn on or off an electrical device.

The command to turn on annunciator (0) is Poke −16295,0. Pin 15 then remains at +5V until turned off by the command Poke −16296,0. The only complication arises from the fact that the Apple can only provide a few millilamps of current, so some degree of amplification is called for.

In figure 1, the annunciator output is taken to the base of an NPN transistor such as a 2N-2222, with a relay placed in the collector circuit of the transistor. When the +5V signal arrives at the transistor base, the transistor allows current to flow through the relay coil, which in turn switches on whatever appliance is connected to the relay contacts. The power to operate the relay coil is best derived from an external source, such as a 9V battery.

In figure 2, complete electrical isolation is achieved by having the annunciator output turn on an LED which shines on an LDR in the control circuit of a similar transistor. The LED will not draw more current than the Apple can safely provide. The optical coupling to the LDR prevents any expensive surprises which might result from accidental connections between the computer and the apparatus being controlled.

The program in listing 3 could be used to switch on a fan and give a warning beep if the temperature rises too high. The value 200 in line 110 should be adjusted to suit the characteristics of your thermistor and the switch-on temperature required.

The Game I/O connector is shown in figure 3. In most cases, only four or five wires will be needed. Since the connector is small, it is best to keep down the number of wires and use very thin, stranded wire. The connection is made using a 16-pin Dip header obtainable from Tandy, for example. Carefully solder the wire in place, using a soldering iron with a very small bit. If you are a novice with the soldering iron, be very careful that no solder bridges are formed which might connect one pin with another inside the header plug.

A lead length between 18in. and 24in. should be adequate. You can start by experimenting with just two wires, connected to the +5V on pin 1 and GC(0), pin 6. The other ends of these wires can be terminated with insulated alligator clips, or soldered directly to the thermistor or LDR leads. Take great care that the bare wires do not touch each other, or any part of the Apple, otherwise expensive damage could occur.

Table manners

Call it an array, matrix, vector or what you will, the humble table is one of the programmer's best friends. Mike Lewis explains how to use it properly.

NOT SURPRISINGLY, there are well established techniques for sorting, searching and manipulating tables. Since this column is dedicated to helping you get the best out of your programming I will be discussing some of these techniques, as well as other programming topics, in this and future issues.

One of the problems that good table handling can solve is direct access to disc files by means of a symbolic key. Suppose you want to access the membership file of your local tennis club. If each member can be identified by means of a simple, consecutive serial number there is no problem. The Get command in Microsoft Basic, allows you to read data from disc by means of a record number, and most other programming languages allow you to do the same. So to get member number 5 you simply read record number 5.

But it would be much more convenient if you could reach your members' records with an alphanumeric key such as their initials or their names, rather than by an impersonal, easy-to-forget number. Some languages include the means to access files in this way: the Find command in dBase and the symbolic key option in Cobol are examples. But most micro languages do not, which is where the table comes in.

The first step is to build a table holding the keys in the same sequence as the records in the file. Your program must look at every record in turn, extract the key — which obviously must have been stored in the file in the first place — and add it to the table. The sequence of the records within the file is immaterial, and the keys do not all have to be the same length. Then, when you want to access a specified member's record, you search the table for the key. The position of the key within the table specifies the member's record number.

Crude search

The program in listing 1 shows a crude way of doing a linear search. It is the simplest possible table search and it requires no further explanation. You look at each table entry in turn until either you find the one you want or, if the key is not in the table, you drop off the end.

I have used Basic for this and other examples because it is still the most widely known language. It is the technique that I

This column is dedicated to helping you get the best out of your programming. Even if you are one of those sensible micro users who normally tries to avoid programming at all costs, please stay with us as every month Mike Lewis will be passing on tips for using popular packages like WordStar, dBase II, Supercalc and the like.

How to sort the table

Exchange sort. Far and away the easiest sort to code, and also the least efficient. You compare each pair of adjacent table entries, swapping them if they are out of sequence. Keep repeating until you have done an entire pass of the table without any swaps.

Binary insertion. For each entry in turn except the first, look to see where it fits in the sequence of the entries before it. Move all the entries below this insertion point down one place, then place the current entry in the gap thus created. The method is similar to the one you would use to sort a hand of cards. It can be very fast, especially if a binary search is used to find the insertion point.

Counting sort. Here the aim is not to put the entries in sequence, but to determine the ranking of entries within the table. You end up with a second array, which follows the same sequence as the main table and which contains an integer to indicate the rank — 1 = first, 2 = second, etc. — of the corresponding entry. Compare each entry in the main table with each of the subsequent entries. For each comparison, increment the count in the second table that corresponds to the lower of the two entries being compared.

Heap sort. Put each adjacent pair of entries in sequence. Then merge each pair with the next pair, creating a run of four. Merge these four with the next four to create a run of eight; and so on. This is the most practical method for very large sorts where the intermediate groupings must be held on disc files.

Shell sort. Similar to the exchange sort, except that you start by comparing far-apart elements. It is reasonably fast.

Merge sort. This is another method that comes into its own for large sorts. Start by loading a small section of the file into a table, and sort it using any of the previous methods. Write the sorted table to a work file on disc. Then sort the next section of the original file, but this time merge it with the work file. Repeat, merging each sorted section with an ever-increasing work file. After the final pass, the work file will have become a sorted version of the original file.

Listing 1.

```
2000 REM --      SIZE% is the number of items in the list; ARRAY$(SIZE%) is the
                 list; ITEM$ contains the item which we are searching for.
2010 FOR J%=1 TO SIZE%
2020    IF ITEM$=ARRAY$(J%) THEN GOTO 2100
2030 NEXT J%
2040 REM --      Come here if required item not found
                 ...      ...      ...
                 ...      ...      ...
2100 REM --      Come here if found; J% is the required record number
```

wish to illustrate; the logic can be coded just as easily in other languages, such as Pascal and C.

The simple linear search is extremely easy to program, but it suffers from being very slow. On average, a successful search must test half the entries in the table, while an unsuccessful one must test them all. Most of the methods of improving the search depend on the table being pre-sorted so that the keys are in ascending sequence, but it is only worth doing if you are likely to be performing many searches in the same session. In fact there are dozens of ways of sorting a table. Andrew Featherstone described several of them in a series of articles "Know Your Sort" published in the March and April 1983 issues of *Practical Computing*, and they are summarised in the box on the opposite page.

The trouble with sorting the table is that you can no longer rely on the position of the key within the table to indicate the record number. To get round this, you must keep a separate list of record numbers which you sort in parallel with the main table.

Time halved

Once your table is in sequence you can improve the performance of the search by branching out as soon as a table entry is greater than the specified key. This will not speed up a successful search but it will, on average, halve the time needed to discover if a key is absent.

If you are going to the trouble of sorting the table, you might as well go further and do a binary search. This is the classic way of searching a table, and while it is a little trickier to code it will greatly improve the speed of the search.

In the binary search program shown in listing 2 you start by testing the searched-for item against the middle entry in the table. If your key is below this value, you confine the next stage to the lower half of the table; if it is above, you confine it to the upper half. You then test the middle entry in the chosen half, thus confining the next stage to one-quarter of the table.

Homing in

You repeat the same process, halving the search area each time. As you can see, you very rapidly home in on the required item. Whatever the size of the table, the number of comparisons is kept to a minimum, giving a very fast search.

Another approach to table searching is the percolated search, which does not require the table to be sorted. Instead it takes advantage of the fact that some entries are accessed more frequently than others. The percolated search is just like the simple linear search, except that each time that you find a hit, you swap the entry with the one immediately before it. So the more frequently used elements will gradually percolate through to the start of the table, making each subsequent search a little faster.

This technique really comes into its own if you can arrange to write the table back to disc at the end of each session, thus accumulating the benefit. An idea similar to percolation forms the basis of the least used/first discarded algorithm, which has many uses in programming and will be dealt with in a later article in this series.

Listing 2.

```
2000 REM --       SIZE%, ARRAY$ and ITEM$ as in
                  previous examples; a separate
                  list RECNO% (SIZE%) contains
                  the record numbers, and is in
                  the same sequence as ARRAY$.
2010 LOW%=0: HIGH%=SIZE%
2020 WHILE LOW%<=HIGH%
2030      J%=(LOW%+HIGH%)/2
2040      IF ITEM$<ARRAY$(J%) THEN
                  HIGH%=J%-1
          ELSE
                  IF ITEM$>ARRAY$(J%) THEN
                        LOW%=J%+1
                  ELSE
                        GOTO 2100
2050 WEND
2060 REM --       Come here if requ ired item not found
                  ...       ...       ...
                  ...       ...       ...
2100 REM --       Come here if found; the record number is in RECNO%(J%)
```

When things crash

I PICKED UP a useful trick from a group of enthusiasts who revel in the name CPMUGUK, which stands for CP/M Users Group United Kingdom. The idea is to have a quick way of getting back into a CP/M program when it crashes — that is, when a BDOS error or similar tragedy causes a return to CP/M command level.

Before you can use this dodge your disc directory must contain a COM file of length zero. This is easily achieved by typing, at command level:

SAVE 0 RESTART.COM

Of course, Restart is just an example. Any valid name will do.

Next time your program crashes, just type Restart. The effect is to pass control back to the program that was running when the crash took place, without disturbing the transient program area, TPA.

With a bit of luck, everything in the TPA will be just as it was before. For example, in MBasic your source file and variables will be preserved. I cannot guarantee that this will work every time, but think how much aggravation it could save you when it does.

WordStar wisdom

I HAVE BEEN USING Micropro's WordStar word-processing package regularly for the last four years. Yet I am still discovering new tricks and techniques.

Take, for example, the dummy Find and Replace, which is useful if you wish to type a particular word or phrase many times in the same text. You might perhaps be writing a thesis on logical positivism. It would be nice to have a quick way to type these two words over and over.

You do it as follows. Enter Control-QA. WordStar asks

"FIND?"

Press Return, and WordStar asks

"REPLACE WITH?"

Type "logical positivism", or whatever, and WordStar asks

"OPTIONS?"

then press Return.

From now on, every time you want to type "logical positivism", just enter Control-LY. WordStar interprets the Control-L as a dummy Find, and it duly finds whatever is at present under the cursor. It then asks if you want to replace it, and interprets the Y as "yes", so the required word or phrase appears at the current cursor position.

Sounds familiar

David Clarke programs the Soundex algorithm, which will find a set of similar-sounding entries.

IN MANY computer applications it is necessary to keep a list of names. Common examples include customers and suppliers for businesses, passengers for travel agencies, clients for the professions, and patients for hospitals. This telephone directory program illustrates some of the techniques that can be used in managing and searching such lists.

The program is written for the 40-column Commodore Pet but uses no machine-specific features of Basic other than the screen-formatting characters, which are described in the text. The program will run in 8K but with a restricted directory.

One of the problems encountered when searching name lists is that the name being sought may not be known precisely. For instance, my own name is frequently spelt "Clarke" or "Clark" and sometimes even "Clerk or "Clerke". Clearly when searching the index it is useful to show all the entries that are phonetically similar.

The Soundex code has been devised for this purpose. As implemented in the program the steps in coding a name into its Soundex equivalent are as follows:

1. The first letter of the code is the first letter of the name.
2. Subsequent letters of the name are replaced as follows:
   B, F, P or V — replaced by P
   C, G, J, K, Q, S, X or Z — replaced by S
   M or N — replaced by M
   L or R — coded without change
   A, E, I, O, U, W, H or Y — not coded
   All consonants with similar pronunciation are grouped together.
3. A sequence of uninterrupted letters of the same coded value is replaced by a single code letter, though this does not include the first letter of the name. It can be included by changing line 2000 to read
   SD$ = LEFT$(NM$,1):L$ = SD$:N = 0
4. The code is forced to be exactly four characters long, either by truncating or by padding at the right with the letter A.

The routine to perform the coding is at lines 2000 to 2160. In the examples shown in figure 1 phonetically similar names code identically, though the quirks of English spelling and pronunciation mean that this will not always be the case. "Belvoir" codes to BLPR, whereas it may be pronounced "Beaver", which codes to BPRA. Similarly "Bough" codes to BSAA but can be pronounced "Boff" or "Bow", which have Soundex codes of BPAA and BAAA respectively.

The Soundex code is sufficient to find entries in a small personal telephone directory, but it would only form part of a search algorithm for a larger index. Typically such lists are searched in stages, with the search critieria becoming less restrictive at each stage.

Thus the first stage could be to look for an exact match on surname, initials, sex

and date of birth. If this failed to produce the required match, the second stage could be to search on Soundex, sex, and year of birth. The particular search method employed depends on the application and the importance being attached to finding exact and close matches.

Various data structures could be used to create the index. The simplest would be a serial array or file. Additions would always follow the last-used record in the array, the array having been declared large enough for anticipated expansions. Deletions require the index to be searched for the entry to be deleted, and this set to a special value such as Deleted or "", the null string. If there are a lot deletions there will need to be a procedure to recover the deleted records. Searching the index for all matches requires every record to be examined.

A more useful structure is the linked list. It is used in the program and is a structure widely employed within more comprehensive data structures and data-base-management systems. A pointer is added to each record, indicating the location of the next record in sequence; the pointer corresponds to the value of the subscript of the appropriate record. Because Basic does not allow you to mix string and numeric variable types the pointers are held in a sparate array, PT%, which is maintained in parallel with the main data array, TP$.

Initially all the elements of the array are assigned to a free list. The pointer to the first element in this list is held in FF and each element of PT% is set to point to the next, so:

PT%(1) = 2
PT%(2) = 3

the last element in PT% is set to zero, indicating the end of the list. Another pointer, FU, gives the subscript of the first used record. The structure is shown diagramatically in figure 2.

Any new record is assigned to the location given by FF, the first record in the unused record list; it is subscript 7 in the example. The free-list pointer is then reset to the value of the pointer corresponding to this record, 18 in this case.

The new record is linked into the used list so that records are kept in sequence. Therefore the pointer for the record of key GHK is set to the subscript of the new record 7 and the pointer of this record set to point to the record 4, formerly pointed to by GHK.

Deletion of records is simpler. The free-list pointer FF is set to the subscript of the record being deleted, while the pointer for this record is set to the former value of FF, thus linking the deleted record to the head of the free list. The record that previously pointed to the deleted record is set to point to the record formerly pointed to by the deleted record. Both these procedures require additional coding to deal with addition/deletion to or from the start and end of the list.

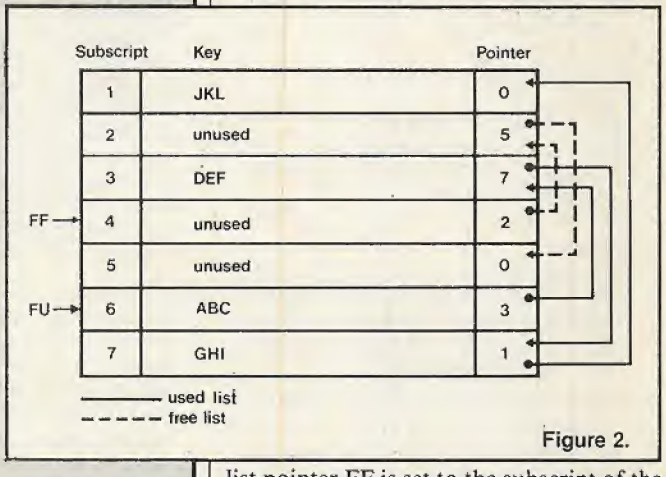

Figure 2.

Searching is carried out sequentially following the pointers. This ensures that keys are scanned in ascending sequence and the search is complete when the key of the record being compared exceeds the key being sought.

The linked-list structure is quite suitable

(continued from previous page)

for records held entirely in RAM but requires the addition of one or more index when extended to use backing store. It may still form the basis of such a system, having the particular virtue of allowing additions and deletions without major file restructuring.

The program to implement these procedures has been constructed in a modular fashion, as modular programming simplifies coding, testing and subsequent enhancements. The art of coding is in solving the problem and designing the solution. The first step is to define the problem; coding should be left as late in the programming cycle as possible. If the program has been well planned and designed from the outset, coding becomes a largely mechanical process.

The next step is to reduce the solution to a set of modules. At this stage you may prefer to use a structured pseudo-language or a flowchart. The main requirement is that modules should be functionally well defined and small enough for their purpose to be clear. It should also be possible to code each one in a reasonable number of lines. I always assign routines to line numbers advancing by 200 and expect to code the module within the 200 lines with line numbers advancing by 10, allowing space for 20 lines of code.

In Basic, each model except the controlling module should be coded as a subroutine. Because the purpose of the modules can be clearly stated, and they are not too large, they should present no coding difficulties. Furthermore they can be implemented top-down.

Each subroutine is initially coded as a stub, which may simply be a Return or more usefully a line of code to print the subroutine name and then Return. As each subroutine is coded it replaces its stub, and so the program is gradually built up. Where necessary the stub may set values in variables to simulate its actual function, the routines being added and tested one at a time. As the process continues the common routines will be frequently used and you will become increasingly confident in their correctness. PC

Variables.

NN — number of records assigned to index
TP$(NN) — telephone index
PT%(NN) — record links
RC$ — index entry
NM$ — name
SX$ — sex
AD$ — address
TL$ — telephone number
SD$ — Soundex code
NP — pointer to next record
IP — pointer to previous record
CP — pointer to current record
FU — pointer to first record of index
FF — pointer to first unused record
IP$ — input action key
LF$ — name of file to be loaded
SF$ — name of file to be saved
UD — update flag, set to 1 if file is created/amended
ER — error flag
ND — number of records being displayed
SE$ — separator character, ","
CD$ — cursor-movement string
A$, N, I, N$, L$, C$, J, K, L — general-purpose variables

Routines.

Cursor-movement characters peculiar to the Pet are shown by codes inside square brackets. The codes used are: CD, cursor down, HOM, cursor home; and CLS, clear screen.

Master Routine, lines 200-310. Calls the initialisation and instruction routines. Accepts input of action key and calls the corresponding routine.

Initialisation, lines 400-410. Sets up constants and initialises UD to zero, showing that initially the Index does not require saving. Open 1,0 in line 410 opens the keyboard as an input device. Data can then be accepted from the keyboard by Input#1. The advantage of this is that pressing the Return key on its own does not cause the Ready display, but is ignored. The disadvantage is that a literal prompt may not be used with Input#1 and the Return which completes entry does not produce a new line on the screen. These disadvantages are easily overcome and are a small price to pay for a program that does not leave the user wondering what Ready means.

Instructions, lines 600-665. Straightforward display.

Load routine, lines 800-890. NN is initially zero; if it is not, an index has already been created/loaded and the user is told of this. The named file is opened and read and the user may extend the file if desired. The additional records are linked into the existing ones by lines 860-870.

Add control routine, lines 1000-1170. Line 1000 ensures records cannot be added until the file has been loaded or created. Details of record to be added are provided for, with error checking, in lines 1010-1100. Commas cannot be used in the input strings as Basic treats a comma as a separator. Subroutine 2000, called in lines 1110, creates the Soundex code. Line 1120 creates the record by concatenating its separate parts. Subroutine 2200, called in line 1130, adds the new record into the index. Lines 1140-1170 cope with the File Full condition detected by subroutine 2200. The user is asked to save the file and then rerun the program and expand the file when it is loaded.

Search routine, lines 1200-1290. Lines 1200-1210 accept the search key. Lines 1220-1240 search through the index one record at a time. The subroutine at 2400 returns CP with the pointer to the next sequential record. Line 1250 detects if there have been no matches, and displays an appropriate message showing that the search was unsuccessful and all matches have been found. Line 1270 prints the matching record and checks that the screen is not full. If it is, lines 1280 and 1290 allow the user to examine the matches before displaying the remainder. The Wait 59410,4,4 in line 1290 is specific to the Pet; it waits for the space bar to be pressed. If this instruction is not entered exactly the Pet is liable to hang on the Wait statement in an uniterruptible state. Some safer alternative code is:
1290 GET A$: IF A$<>" "THEN 1290
1300 PRINT"[CLS]": GOTO 1240

Save Index, lines 1400-1430. The index is saved to a named cassette-tape file. The comma separator between variables must be forced on to the tape by including it specifically in the Print#2 statements.

New Index, lines 1600-1650. Details of the new file are requested, and the corresponding arrays are set up. Lines 1640-1650 link all the elements of the array into the unused list.

End routine, lines 1800-1850. The keyboard file is closed. If the index has been changed the user is given an opportunity to save it.

Soundex, lines 2000-2160. This follows the description given in the text.

Add New Entry, lines 2200-2350. If FF=0, line 2200, there are no unused records and the new record therefore cannot be added. Line 2210 places the record in TP$(FF) and sets up a loop to scan for the correct place at which to add the record; lines 2220-2240 form the body of the scan. The scan is left either when the correct point has been found or all the used records have been examined and NP=0. Line 2250 caters for addition at the start of the index. Lines 2260-2270 add the new record into the index. Line 2280 caters for an addition to an empty index. Lines 2290-2300 cater for an addition at the end of the index.

Next Record, line 2400. Resets IP, CP and NP.

Record Display, lines 2600-2690. The main part of the routine, lines 2610-2670, separates RC$ into name, address and telephone number. The actual display is at line 2680. Line 2690 increments a counter of the records displayed.

Delete, line 2800-2910. The key of the record to be deleted is entered in line 2800, and the index scanned to find it in lines 2810-2840. Lines 2850-2880 give the user an opportunity to abandon the delete. Lines 2890-2910 delete the record as described in the text.

Key Entry, 3000-3090. The name and sex are accepted as input by lines 3020-3070, and the Soundex code is created by line 3080.

DIAL-A-DISK

– Order Hotline.

☎ 01-541 1144

Call Richard Mortimore or Felix Benzimra, to order your disks. Our answering service will record your order out of hours.

HOW TO ORDER:

1. Complete the coupon below and post with your cheque. Use our FREEPOST address for minimum cost, or send first class for extra speed.
2. Urgent orders:- DIAL-A-DISK. 01-541 1144. Dictate your order with a credit card number and they're as good as received. COLLECT FROM OUR OFFICES – phone and they will be waiting for you. From 10.00 to 17.00 Weekdays. (Other times by arrangement).
3. Crucial Orders Same day service, phone 01-541 1144 to arrange. We guarantee you will receive them. If not we'll refund the carriage.
4. Official orders – Orders from Official bodies are very welcome (eg Govt. Depts. Local Authorities, Universities etc.). Tenders for large purchases will receive immediate attention and low bulk prices. Urgent official orders by telex to 932905 (LARCH G).

Tomorrow's world

by Andrew Walker

DE CRECY watched Madame Zsa-Zsa's ample bosom heaving after their exertions. Only a true patriot could make *l'amour* so passionately; she could not be an English spy.

Suddenly the door burst open and the macho Don Sebastian, Ambassador to King Philip of Spain, strode in holding his weapon.

"French whore," the Spaniard declared. "This is how you keep faith with me."

His rapier rested upon De Crecy's nipple.

"Prepare to die, you cur."

Fearlessly, the brave De Crecy awaited the final thrust.

INSPIRATION EXHAUSTION
ABORT

"Oh shit," said Lord Seymore.

A monocle fell from his eye.

"Ouch," said the gold-rimmed monocle as it hit the floor.

The trappings of his ancient peerage surrounded him in the library of the family's medieval mansion: bookshelves piled high with fusty books; deathwatch beetle tap, tap, tapping overhead; dust collecting on the disc drives, keyboard, and VDU, even on Seymore himself. Dirty sunbeams oozed through dirty window panes, staining the floor with anaemic light.

Seymore had struggled all day dictating another best-seller into his word processor, but the story had gone. His second Nobel prize would have to wait: he could not afford to buy another one at the moment.

He glanced outside at the police storming the gates.

"Shit," he repeated. He slammed the microphone on to the desk.

"Ouch," said the microphone.

"Oooh," squealed the masochistic desk with pleasure.

Seymore muttered something under his breath about "goddamn intelligent machines".

"Curtains," he commanded, and the curtains drew across the window just as one of the policemen mounted the fence and was fried in a laser beam.

"Three-D TV," Seymore commanded, swivelling in his chair to face the screen.

The picture was fuzzy. He had had to repair it himself, because the rental company was reluctant to lose any more staff. They were still suing him over the last five repair men, who had been disintegrated by his over-zealous bodyguards.

The President was speaking.

"Furthermore," she said, projecting her voice across the country, "it is my view — and the view of the American people — that this man should not escape punishment lightly, that his advantaged position should not afford him the slightest clemency. Therefore, in accordance with the powers vested in me, I decree that he should spend no less than 25 years in the state penitentiary for the crime of attempting to pervert the course of justice." She paused to allow her audience to stand and cheer and clap and pick each other's pockets.

It was election year and the man she was sentencing was a senator on her own staff. He was the vote-saving sacrificial goat. He had originally been convicted of underbribing a public official and sentenced to 50 lashes. Being 93 years old he had died of exposure the moment his shirt was ripped from his back.

The public cry of outrage had shaken the foundations of the White House. A presidential aide had gone unpunished: had his money tipped the scales of justice? Had the President bent the law to suit her own ends? Had his lawyers found a new loophole in the penal system? Rumour abounded.

Defeat had previously been inconceivable. She had risen to power with a landslide victory: Mount Rushmore had mysteriously crumbled and her opponent was crushed in the rubble of Washington's left nostril. She was the idol of the American minorities. Her biograpy showed her to be black, Roman Catholic and of Chinese and Puerto Rican descent, which gave her the backing of 75 percent of the people.

Despite this, her position had been threatened by the moral indignation surrounding the senator's indiscretions.

The senator was also disliked by her biographer, the influential chief programmer for Robo-of-America, who had designed and still maintained her.

Mad Dan the gardener walked rudely between Seymore and the television carrying his blood-stained axe. Tall and gaunt, he spoke to no one but carried out his duties while whistling a tune.

He swiped at a fly as he left the room. The fly dodged.

"Missed me you old . . ." Its curse was cut short as it flew into the wall.

It picked itself up, dusted itself off, and followed Dan from the room into the large cobweb-ridden hallway. There it ignored Dan and made for the nearest of the mousetraps that littered the floor. The cheese looked good but a mouse beat him to it and pounced. The trap snapped shut.

"Ouch," cried the mousetrap.

"Aaaagh," screamed the mouse, which otherwise kept its trap shut.

The cook rushed from the kitchen, her heart set on the fresh ex-rodent.

"Mouseburger and chips for His Lordship's lunch," she chortled, licking her lips enviously.

The fly, grateful to her for opening the door, flew into the kitchen. A slab of steaming red meat lay on the window sill, playground for a gang of bluebottles and a million bacteria.

"Lord Seymore — enemy of the people!" An instinct that had been burned into his memory flashed before him. His mission: to assassinate Lord Seymore by contaminating his food.

The American Nationalist Army of liberation had plotted the mass murder of all imperialist oppressors for 10 years. They had designed the super bluebottle at a cost of several billions, and each one was individually programmed for a specific target.

The creature's eyes lit up when he glanced into the corner where the potatoes lay in a pile. A soft, warm pile of doggy-droppings. As he made the approach run his senses were raised to new heights. The excrement's aroma grew, his lust became insatiable, a tidal wave of desire washed over him.

INTERRUPT
"COME-INTO-MY-PARLOUR" WARNING

With a swipe of contempt he brushed aside his logic chips and landed.

He could not move. With all his might he tried to lift his feet but not one of them would budge. Panic seized him, a subconscious awareness of danger. He looked around to cry for help . . . his friends on the sill. He called out. They did not hear.

A fast-rising horizon blotted them from view. This mass that once promised heaven now threatened hell. It swelled before him, putrefying as it did so.

And then it was a mountain, towering above him, engulfing him, burying him in an insecticidal tomb.

"My god, these fiendish humans," was his final thought.

"And now a word from our sponsors," the TV blasted.

Ted Teeth, smiling adman, was earning another million plugging the latest micro-products.

"Yes folks, take it from me — it really fools all known insects. Remember the name: Crap-a-Fly, the world's first fly-catching dog turd. Made by Turdomatic Inc., a subsidiary of tonight's sponsors, Robo-of-America."

So now what? Should he return to De Crecy's predicament? He shook his head: not in the mood. What about the children's story he was dabbling with? What was it called? He searched his memory, drumming his fingers on the desk top, sending its insatiable sensors into electro-orgasm.

"Susan the Dragon and the Robot Gang-bang," he recalled aloud. It had a certain ring to it.

Queen Henry was executing orphans for not writing games programs on their micro-computers. Prince Peregrine was playing Dungeons and Dragons with the real thing, while King Twit III was molesting sheep on the croquet lawn.

It was rubbish, Seymore knew, but that was what the kids wanted. He just could not conjure up any enthusiasm for it though. Perhaps tomorrow.

"I'm not waiting all day," thought the microphone, and switched itself off.

He considered setting the machine on auto. His agent had insisted that he had his brain profile saved on disc.

Brain profiles were all the rage. Every cell was copied — the sum total of his thoughts for the rest of his life. The computer could use the disc to generate new ideas, working in parallel on up to four novels, writing in hours what would have taken Seymore a lifetime.

Many rejected the whole thing as inhuman, claiming that literature was the last bastion of natural creativity and that it should be defended against the invading automaton hordes. Most writers set them to work and retired to live off the 10 best-sellers a year that they produced. Unscrupulous publishers killed their authors, taking the profit from the obedient, prolific emulators.

"It'll guarantee this year's Nobel," Seymore pointed out. But he shook his head. It was too impersonal. He preferred the human touch.

"Curtains."

Daylight flooded the room, and before Seymore's admiring eyes lay the scenery of Death Valley. It was all there: the Tower of London, Buckingham Palace, Ben Nevis, Blackpool's Golden Mile: most of Britain had been shipped to the States, leaving only Scunthorpe and bits of Manchester behind.

Mad Dan walked across the garden cutting the grass, short and black as it was. All the time he looked to the sky. The flowers were in midsummer bloom with charred petals on withered stems. The goldfish were sunbathing, or so Seymore thought. Actually they had died from radiation poisoning, which caused them to glow in the dark, a phenomenon that had always puzzled him.

(continued on next page)

Tomorrow's world

(continued from previous page)

Albert was watching the fish: he had nothing better to do. Being Lord Seymore's favourite gnome was no fun; being his only gnome made it unbearable. The others had run off because of the conditions and poor wages. They had gone to work on the Paris Underground, getting jobs as Metro-gnomes.

Albert rolled his trousers down and began defecating on the flowers. A duck-billed-chicken-rabbit hopped across the garden, its fluffy feathers ruffled by the hot nuclear breeze. It was one of the few Nubreeds still permitted to roam wild.

Amateur Genetic Engineering had taken off in a big way until the world's governments had banned the disastrous experiments of the less ethically minded participants. The last straw was the nesting of the elephant-sparrows, and the terror of the red-admiral-piranha still lived in the memories of the survivors.

Seymore himself had built up a large safari park of these quirks of science. His rhinocerhorse, resembling the unicorn of legend, had been a great crowd-puller, while around thanksgiving the delicious octopus-turkey sold well to large families who all wanted a leg.

"Quack," said the lion-giraffe-duck. Despite government orders, Seymore refused to destroy all his creatures. It bit Albert's head off.

"Ouch," cried Albert's head, the cry echoing down the long throat as he slid slowly along. His body squatted above the flowers, nonplussed, wondering where his head had gone.

A laser flash caught Seymore's eye. The security team was defending his freedom again. Police Commissioner Macdonald had been converted to a heap of cinders as he dropped over the fence, shot-gun in hand.

Seymore tut-tutted. All that money in bribes and this was how the likes of Macdonald repaid him.

."Damned unemployed scroungers," he cursed.

Ever since he had been replaced by Commissioner Macrobot, Macdonald and his men had lain seige to the Seymore estate.

Seymore had never understood people's rejection of phased leisure progression. Why work when the government was willing to let you retire and have a machine to do your job? He shook his head in wonder.

The police no longer had to face day-to-day dangers: no more homicidal maniacs, no more shootouts with liquor-store robbers. Anyway, most of the big-time crooks had robots of their own built to do the jobs for them.

Who else was out there? Seymore panned the camera. It was hard to recognise anyone, charred and bloodied as they were from the pounding they were taking from the Cybercops.

The media were there in force with their autofocus, remote-control cameras, relaying live television picutres and their image-translators that turned the pictures into the written word for the newspapers. Vultures gorged on the carrion of the day's crises. The auto-reporters paid particular attention to the old journalists, who with the ex-cops and others were trying to tear down the fences.

Le Blanc was there, the physicist famous for perfecting hand-held laser weapons. Wilson and Tate, the science-fiction writers, had reached the inner perimeter but had fallen into the clutches of the voracious doberman-cockroaches and were quickly being devoured by the seven-feet-wide genetic abominations. The members of the Computer Programmers Union had long since perished in the same way.

The defences were gradually being overwhelmed as more of the rioters climbed over the wires, pushing the Cybercops back step by step, drowning them in numbers.

The drone of engines caught everyone's attention. The fighting stopped, all eyes cast to the sky. Mad Dan burst into aimless, rabid action.

The aeroplane came out of the sun, unmarked and mysterious. As it passed overhead, a single parachute began to descend. A deathly silence fell over the Valley. Rioter and Cybercop stood side by side. The chilling thought ran through all minds: "Was it the enemy's super-bacteria? Was this the end of the world?"

Lives flashed before eyes. Who would remember them when tomorrow had come? The insignificance of their existence hit them like a slap in the face. How could they start again, afresh? Images of what could have been, what still could be, reflected in the tear-stained mirrors of their eyes, shining through the dim myopia of reality. But it was too late.

The package cradled beneath the parachute landed with a thud. Mad Dan ran forward through the concentrated gaze of the onlookers, ripping it open to reveal the coffin-like box within. He prised the lid up and stopped, wide-eyed.

She was beautiful: an Amazon. He pulled her from the container and stood her up to admire her full glory. "I'm gonna turn you on, baby," he promised learfully. His hand strayed nervously to her left breast, and with a hasty jab of his finger he flicked the bright red switch on the nipple.

She simmered into life, stretching felinely, displaying every elegant sensuous curve. "Hello Big Boy," she oozed, letting rip with a slow, deliberate wink. "Robo-of-America made me yesterday. You can make me today." She was barely able to keep her feet as Dan dragged her home.

A wave of relief washed over the rioters. It had not been the super-bacteria after all. When tomorrow came they would still be there. They could build a new tomorrow.

Le Blanc started it. He lashed out at the nearest robot with a length of broken gatepost. The victim crumbled to the ground and pandemonium broke out all around. As the blood poured from the shattered skull Le Blanc realised that he had made a mistake.

"Ouch," cried the fence as it fell down under the weight of the Artists Against Robots society. Le Blanc's head skimmed across the grass, severed from its shoulders by the slash of a razor-sharp laser, and landed at the feet of a guard-roach.

"Gulp. Yummy," said the Doberman cockroach as it licked its lips.

The Nuke Warning light suddenly flashed red. Lightning instincts crashed Seymore's fist on to the Alert button.

"Ouch," screamed the button.

Sirens wailed, blast-proof shutters clamped down on doors and windows. The Cybercops stopped beating the invaders and retreated to the safety of the fallout shelters. The guard-roaches withdrew into the woodwork. The rioters simply stopped, puzzled, looking for something to fight.

Seymore was livid: this was an unscheduled attack and a blatant infringement of the right to riot.

Silence fell on the rioters, then death.

Through heavily filtered screens Seymore watched the flash of the bomb. Then the crowd outside melted away.

"Unemployment Down," cried the headlines.

Albert ran blindly for his own shelter, but without a head he bumped into trees, ricocheting like a pinball until at last he fell into the pond. Seymore sadly watched his last gnome turning to jelly in the intense heat.

Shrinking the computer

Ian Stobie discusses squeezing the computer into a calculator's shell in an examination of 10 pocket-sized battery-powered machines with Basic.

POCKET COMPUTERS do not seem to have caught the popular imagination in the way home micros, office personal computers and even the larger-sized portable computers have done. It sems that there has to be a certain necessary power crammed into the package before you have a computer worth anyone's while. Until recently the bottom limit has been machines like the Epson HX-20 and Tandy Model 100, which have full-sized keyboards and reasonable sized displays. Their main advantage is that you can also run practical software on such machines without having to write it yourself.

But a new wave of technical advance is beginning to transform prospects for the very small computer. The notebook-sized Husky Hunter packs CP/M into its small 2.5lb. bulk, and is capable of running WordStar or Supercalc just as fast as the desk-top Sirius I am using now. VisiCalc, the genuine article from Visicorp, can be run on the lighter weight Hewlett-Packard 75C. Admittedly these two machines are the most expensive in this survey, but now is a convenient time to take a look at what is available over the whole range of pocket computers, from super-calculator to super-compressed office system.

Battery powered

For the survey we are defining the pocket computer category to include all machines which offer a version of the Basic programming language, which are battery-powered with at least one working day's battery life, but which are too small to have a full-sized keyboard. Rather than quibble about the size of the standard pocket computer we will include anything with a keyboard smaller than the standard typewriter — calculators are excluded because they lack Basic.

The machines in this survey find at least two distinct kinds of use. Commercial organisations and even the military are using the two successful Sharp machines and the Hunter for data collection, as well as calculation "in the field". Here a prime requirement is to have some means of storing the data collected — micro-cassettes in the case of the Sharps and battery-backed RAM in the case of the Hunter. The other major use for pocket computers is as super-calculators, which are used predominantly on the desk top, but can be moved around.

Machines like the smaller Casios are adequate in the super-calculator role. But some people are tempted to buy such machines as a cheap introduction to programming, and it must be said that the mains-powered home computers from the ZX-81 upwards offer a preferable buy, with their better display, sound facilities, vast range of entertainment software and heavy support from specialist magazines.

Battery-powered portability is not worth paying for if you do not want it, since at present the low power consumption CMOS technology used in battery-powered computers is slower and more expensive than conventional NMOS. Major investment has been going into CMOS, and it is now producing results in the form of cheaper and faster circuits.

Portable flat-screen display technology is also improving fast, with larger LCD arrays coming in further up the market on machines like the Gavilan, Tandy Model 100, Olivetti M-10 and NEC PC-8201. Already Hitachi has a flat-screen TV at the experimental stage.

Finally, various technologies are being explored to get rid of conventional cabling. This offers great advantages for portable computing. The Canon X-07 we have in the office is connected to its mains-powered printer by an infra-red link.

Seiko is introducing a product in Japan in early 1984 which takes matters a step further. Using the induction loop principle, Seiko designers have built a pocket computer split into three components, just like a miniature conventional office computer but without the cables. The processor and 2K of user RAM fit in a box measuring 5.5in. by 8in. which goes on the desk, or into a briefcase or pocket; a completely detached mini-keyboard fits into a shirt pocket, while the display can be worn, watch-like, on the wrist.

The Seiko "wrist computer" is programmable in Microsoft Basic and features a tiny printer built into the system box. The Japanese price works out at around £160. At the moment Seiko in the U.K. pleads ignorance about any wider marketing plans, but if the idea proves successful in Japan we can expect other multi-pocket computer systems.

Details of our top 10 pocketables can be found overleaf. All prices are for unexpanded systems: for the Husky Hunter and HP-75C they do not include VAT; prices for Casio and Sharp machines are VAT inclusive.

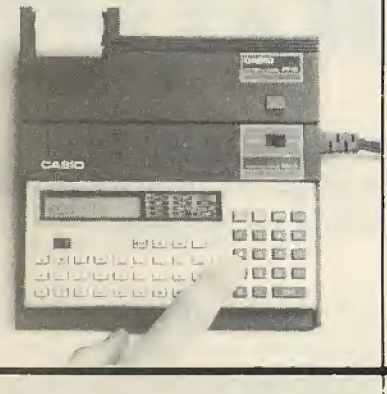
CANON X-07 around £200

If you have room in your pocket for a hardback novel then you could carry an X-07 around instead. The LCD screen shows four lines of 20 characters, and it is just possible to touch-type on its 10mm.-wide button keys. The standard machine has 6.6K of RAM free to an enhanced Microsoft/Canon Basic. Battery-backed memory-expansion modules — the size of credit cards, but thicker — slot in the back. The X-07 is well set up as a system machine via its cassette port, serial port, parallel printer port and expansion port. It can communicate with its own peripherals, including four-colour mains-powered printer/plotter, via an optional infra-red module. Unfortunately, no U.K. version has been produced, but we live in hope.

For. Expandable system. Novel features such as RAM cards and infra-red communications.

Against. Not available. Canon (U.K.) may decide not to import it.



CASIO PB-100 £49.95

A straightforward machine, the PB-100 is aimed at the beginner. It is the size of a largish calculator at 6.5in. by 2.75in., there is a small QWERTY keyboard with separate numeric keypad and a 12-character LCD display. The PB-100 comes with the simple Casio Basic in ROM, and 1K of RAM, expandable to 2K by adding a £14 module. The user manual is particularly good. Up to 10 programs can be held in memory while the machine is switched off. Numeric results are displayed to 10 significant digits but string handling is limited. A cassette interface costs £26; the printer is £60.

For. Low cost. Good manual. Better than a calculator.

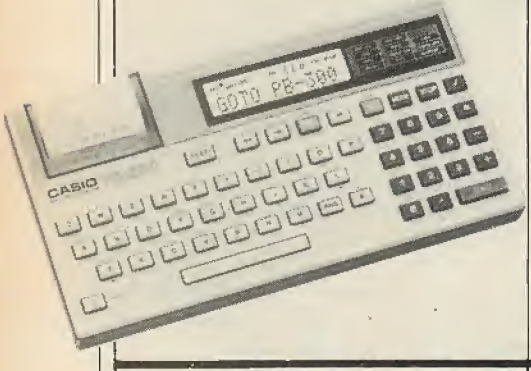
Against. Limited memory expansion. No string handling in Basic.

CASIO FX-700P £59.95

This is the same machine as the PB-100 with a similar Basic, but more technically biased. For the extra money you get single-key entry of scientific functions and 2K of RAM, which is not expandable. The FX-700P is good for numerical work — much simpler to program than a calculator — but the Casio Basic is limited. You are only allowed one string variable, limited to 30 characters, and there are no sub-string manipulation functions. You can use string constants in Print and Input statements. The FX-700P will accept the same peripherals as the PB-100, including cassette interface. No commercial software is available, but a book of useful program listings is supplied with the machine.

For. Scientific functions. 2K of RAM.

Against. No further memory expansion. No third-party software.

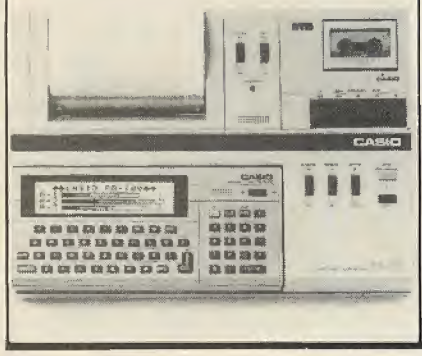


CASIO PB-300 £99.95

Similar to the PB-100 but with a slightly larger QWERTY keyboard and numeric keypad, a built-in printer and more memory. The 20-column printer uses 38mm. rolls of thermal paper. Basic and display are the same as the PB-100. Standard RAM is 2K, but is not expandable. An optional interface costing £26 lets you save and store programs and data on a standard audio cassette recorder. The PB-802P is a scientific version of the PB-300.

For. Good manual. Built-in printer.

Against. Limited string handling.



CASIO PB-700 £139

Top of the small-key Casio range, with a larger display, more memory and a wider range of peripherals. The LCD panel shows four lines of 20 characters or 32-by-160 dot graphics. Standard memory is 4K, expandable to 16K internally. The Basic includes plotting commands and string functions like Left$, Mid$, Right$ and Inkey$. An optional battery-powered slip-on four-colour printer/plotter costing £179 also provides an interface to a domestic audio cassette, or for £70 you can fit the Casio micro-cassette deck to form a single battery-powered unit. Other options include Centronics-type parallel printer port.

For. Better Basic. Larger screen. Good peripherals.

Against. Small keys. Little third-party software. No RS-232 option.

Pocketables: top 10

HEWLETT-PACKARD 75C £763

Luxury machine with wide range of battery-powered add-ons; it measures 10in. by 5in. The HP-75C has calculator-style keys with almost typewriter spacing, and a single-line 32-character LCD display. Standard 16K of RAM is expandable to 24K. The 48K of ROM contains a very powerful Basic with 12-digit numeric precision and good diary/alarm and address-list programs. Genuine VisiCalc is available on ROM for £154. The built-in card reader lets you store 1.3K per thin magnetic card. Wide range of mainly technical software available on cards or on ROM chips. The HP-75C comes fitted with an HP-IL socket which connects it to a wide range of HP plotters, printers, measuring instruments, a full-size display and larger HP computers.

For. Excellent Basic. Optional VisiCalc. Versatile HP-IL interface.

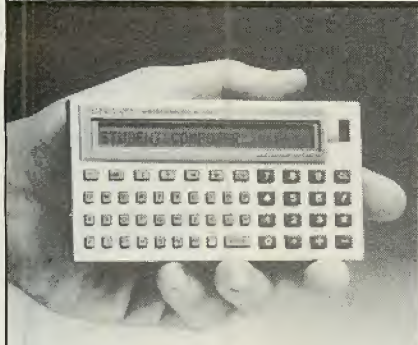
Against. Expensive. Software and peripherals are expensive too.

HUSKY HUNTER £997

The smallest battery-powered machine to offer CP/M. It measures 8.5in. by 6in. and is housed in a rugged cast-aluminium case with a sealed, waterproof keyboard. The eight-line by 40-character LCD display can also show 64-by-240 dot graphics. Standard RAM is 80K, expandable to 208K, some of it configured as a silicon disc. CP/M 2.2 and Microsoft Basic are supplied in the machine's 48K ROM. The NSC800-4 CMOS CPU runs at 4MHz, so it is no slower than an eight-bit mains-powered micro. RS-232 interface included as standard for linking to printers and other computers. Options include modem and mains-powered disc drive.

For. Fast. Very tough, Vast CP/M software base.

Against. Price.



SHARP PC-125 £79.95

Compact enough to fit in a jacket breast pocket this smaller companion to the successful PC-1500 also has good expansion options. It measures 5.25in. by 2.75 in. The standard machine has a 24-character LCD and comes with 4.2K of RAM. A powerful Basic comes in 24K of ROM, offering two-dimensional arrays, scientific functions and a full range of string operations. An optional battery-powered clip-on unit costing £99.95 adds a 24-character thermal printer and a micro-cassette drive. This expanded system has been taken up by commercial users particularly in the financial and engineering fields. A number of third-party programs are available on micro-cassette.

For. Good Basic. Neat printer/cassette option. Commercially available software.

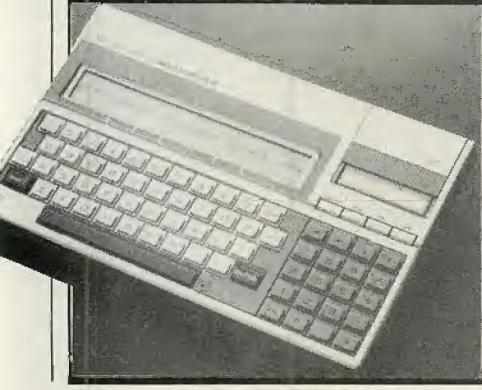
Against. Limited maximum memory.

SHARP PC-1500 £169.95

Longer established than the PC-1251 and offering a wider range of peripherals, greater memory expansion and a larger base of independent software. It measures 8in. by 3.5in. and has a 26-character LCD display. The standard 3.5K RAM is expandable to 11.5K; the 16K ROM contains a powerful Basic with full string handling, arrays and scientific functions. A range of scientific, engineering and financial programs are available on plug-in ROMs. The £149.95 printer/plotter unit uses a four-colour ball-point pen carousel mechanism and also provides a cassette interface. Other battery-powered options include a combined RS-232 and parallel interface suitable for connecting larger computers or modems. Tandy sells the same machine for £159 as the Tandy PC-2.

For. Good Basic. Printer/plotter and RS-232 options. Software.

Against. Small keys. Micro-cassette would be an asset.



TEXAS CC-40 aorund £170

Long-delayed machine first announced in February 1983; should be available in 1984 according to Texas Instruments. It runs an eight-bit CMOS CPU with 6K of RAM, expandable to 16K; the 34K of ROM contains a very comprehensive Basic. ROM software cartridges of up to 128K can be slotted in to the right of the 31-character LCD. The CC-40 weighs 1.3lb. and measures 9.5in. by 5.75in. and is designed to have a large family of battery-powered peripherals including a 36-character four-colour printer/plotter, a stringy-floppy drive similar to the Sinclair Microdrive, and a combined RS-232 and parallel printer interface. We were allowed to examine a sample machine last year, so the CC-40 is not a complete myth.

For. Excellent Basic. Range of peripherals.

Against. Not yet here, a year after announcement.

Many-legged beasties

Ray Coles reveals what goes on inside those little black rectangular packages sitting on the circuit board of your micro.

THE TALE of the chip began back in 1948 when the first transistor was made in the U.S. Researchers in both the U.K. and abroad soon realised the potential of this new solid-state component as a switch to replace the bulky and unreliable electromagnetic relays and thermionic valves then used in the digital computers of the day. It was this breakthrough more than any other which turned laboratory curiosities into the powerful data-processing machines which have become so indispensible.

Transistors may have made the digital computer a practical proposition, but the machines they were used in were by no means easy to live with. They were so enormously expensive that only large government or industrial concerns could even dream of tapping their problem-solving potential. Before long, however, semiconductor manufacturers packaged several transistors together on a single sliver of silicon. There they formed a complete functional circuit such as a logic gate, the basic building block of the computer.

These integrated circuits revolutionised the design and manufacture of computers. This eventually led to the introduction of minicomputers in the mid 1960s which, for the first time, brought data processing into smaller companies and scientific laboratories. The great benefits of these miniature circuits with such low price tags created a tremendous pressure to squeeze more and more transistors on to a single chip. The so called small-scale integration, SSI, of the logic gate soon led to the medium-scale integration of the counter or register, and beyond.

At this point the semiconductor manufacturers began to turn away from the conventional bipolar transistor. The new breed of field-effect transistors were simpler and smaller, which allowed even more functions to be sqeezed on to silicon chips now containing over 1,000 transistors each. Thus large-scale integration, LSI, was born. With several thousand transistors to play with, complete functional systems such as the innards of an electronic calculator could be built with only one integrated circuit. It was not long before Intel realised that a calculator could be transformed into a general-purpose computer.

The first device which was actually given the name "microprocessor" was the Intel 4004. This four-bit general-purpose digital processor was first designed for a calculator manufacturer which wanted to be able to reprogram its calculator chip to produce variations on the theme. Along with a few other pioneers who bought the new device for use in non-calculator applications, Intel soon realised the potential of this new general-purpose digital component.

By the mid 1970s Intel had introduced its eight-bit 8080A microprocessor. It had many features in common with the minicomputers of the day, including a 64K address range, a unified data and instruction memory space and an extensive repertoire of 78 different instructions. Although some diehards still felt that such a puny computer would never catch on, others saw the writing on the wall and began to dream up new applications for the microprocessor.

The concept of a microprocessor-based personal computer appeared around this time. The precedents set by existing computers were still a powerful influence and early designs looked just like their larger cousins. They used separate teletypewriter terminals, alongside paper-tape readers and square CPU cabinets containing rows of individual plug-in circuit boards. It was not the sort of thing for the average living room or office.

Seeing the success of the 8080A, many other semiconductor manufacturers were hard at work to do better, and Motorola had some early success with its 6800, which needed less peripheral circuitry than the Intel device. The two microprocessors which had the greatest effect were the Zilog Z-80 and the MOS Technology 6502.

The Z-80 caused quite a stir when it was introduced in 1977. Its advanced features included a very powerful instruction set, extra registers and a sophisticated interrupt structure. Its compatibility with the 8080A provided it with a ready-made market as a replacement for the Intel device. The CP/M disc-operating system software, designed originally for the 8080A, could be used unmodified with the Zilog processor. Z-80 sales took off like a rocket.

In the same way that the Z-80 was designed as an improved 8080A, the 6502 was produced as a competitor to the 6800. It is to this processor that the honour must go of sparking off the concept of personal computers as we now know them. The simple but powerful architecture of the 6502, optimised for use with high-level languages such as Basic, proved to be just the thing for Commodore Business Machines to use in its now famous Pet.

The separate functional units typical of the big computers were replaced by an integrated system with built-in keyboard, VDU screen and cassette-tape unit. Instead

The 6502, like many other microprocessors, is housed in a 40-pin plastic dual-in-line package measuring 2in. by 0.6in. The semiconductor chip itself is in the centre of the package and measures typically 0.3in. square; most of the package volume consists of just plastic or metal frame. Much smaller packages are therefore possible, and are available for high-density applications. Some 16-bit microprocessors may need more than 40 pins, and this has triggered the development of much larger packages. One trick commonly employed to reduce the number of pins is to multiplex or time-share the data- and address-bus pins. This demands additional circuitry to de-multiplex the information outside the microprocessor package.

of loading the Basic interpreter into RAM from a paper tape or cassette the operating system and a Basic were inside the machine, stored in permanent ROM. Best of all, the concept of separate plug-in circuit boards for CPU, memory and I/O functions had gone. Although this reduced flexibility it cut costs dramatically. For the first time, the smallest business budget could withstand a computer, and schools and some lucky households could afford them too. Alongside the Pet, Tandy's TRS-80 with its Z-80 processor and the 6502-based Apple led an American personal-computer boom.

Home users

In Britain Sinclair Research introduced a computer aimed for the first time at High Street stores and the ordinary consumer. The educationally sophisticated but relatively impecunious British home market helped Sinclair create a brand-new low-cost computer formula, turning the tables on the Americans and the Japanese. Where Sinclair led, other British brand names in the computer stores, like Oric, Dragon and Lynx, have followed into the burgeoning computer departments of the country's chain stores.

Meanwhile there was brisk business back at the semiconductor manufacturers, and the resulting profits led to massive investment in the development of new and more exotic microprocessor chips. Eight-bit designs like the Z-80 and the 6502 are now cheap and easy to make, and semiconductor technology has moved on to provide smaller geometries and more transistors per chip. The 8080A and its contemporaries had from 5,000 to 10,000 transistors on a chip. Today 50,000 to 100,000 is routine, and by the end of the decade, microprocessors with 1,000,000 transistors will be commonplace.

There is always a time lag before a new device appears inside a commercially available microcomputer, but 16-bit microprocessors have already provided another quantum jump in processing power since the advent of the first personal computers.

Eight-bit data words can represent a single ASCII character or provide a numeric resolution of one in 256. They are about the smallest units that can usefully be employed in a practical data processor. But eight-bit resolution is not adequate for most numeric applications, so even in eight-bit machines multiple operations are necessary to achieve the more usable arithmetic precision of 16 or 32 bits. So for every simple calculation made by the Basic interpreter, several eight-bit operations have to be performed one after the other, which slows things up considerably.

Extra goodies

Though improved computational performance is the main driving force behind the move to 16- or 32-bit microprocessor chips, many other benefits are provided too. With 16 bits to play with, more instruction codes become possible and lots of new features can be added to the instruction set. As the data bus becomes wider so does the address bus, and the 64K maximum memory map exands to a megabyte or more.

The technology which manages to squeeze a 16-bit processor on to a chip also allows features such as extra registers and hardware multiply/divide units to be incorporated. As a result, the 16-bit microprocessor is much more than twice as powerful as its eight-bit predecessor.

The first 16-bit processor to see wide use was the Texas 9900. It appeared early

(continued on next page)

Many-legged beasties

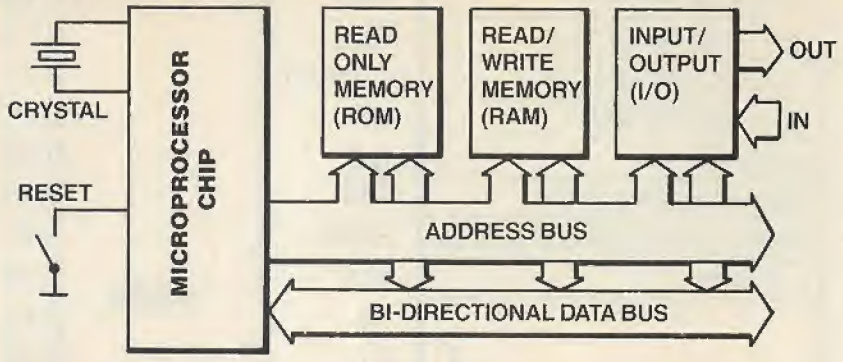
(continued from previous page)

because Texas decided to miss the eight-bit evolutionary step altogether. This proved popular in embedded computers for avionics and the like, and was built into a home computer by Texas itself. It never really caught on, perhaps because of its unusual architecture based on the Texas 990 family of minicomputers.

The first 16-bit device to achieve real prominence was the 8088/8086 family from Intel. This company is still a market leader, after the success of the 8080A and its successor the 8085. The 8086 provides the power of a mid-range minicomputer from a single 40-pin plastic package with a 16-bit time-multiplexed data and address bus. Though the 8086 package is no bigger than that used for earlier eight-bit devices, 20 address bits are available to provide access to 1Mbyte of memory. Its only major limitation is that its internal addressing techniques restrict access to four 64K segments at a time.

The cost-sensitive personal-computer market was not really ready for the 8086 when it first appeared, so Intel launched the cut-down 8088 at almost the same time. The 8088 is cut-down in only one sense: it uses an eight-bit data bus in place of the 16 bits of the basic 8086. Inside the 8088 is a complete 8086 16-bit processor with a full-

How it works



When the microprocessor is powered-up or reset it wakes up in a predefined state and begins to fetch instructions from memory and to execute them. The rate at which it does this is determined by the crystal-controlled clock oscillator which is used to synchronise all activity. The processor fetches an instruction from ROM or RAM memory by issuing an address on the address bus and then reading the instruction it has addressed into its internal instruction register via the data bus. What the processor does next depends on the instruction to be executed, but instructions may involve internal arithmetic and logical operations, or further external bus activity in transferring data to or from the RAM memory or input/output ports. Since the address bus is always driven by the processor it is uni-directional, but data may be transferred in either direction on the bi-directional data bus. The amount of memory which can be accessed by the processor is determined by the address-bus width, which is usually 16 bits for eight-bit processors. The "eight-bit" label actually refers to the width of the data bus which determines the precision of the data which can be handled in one transaction. The main reason that the newer 16-bit machines are more powerful is that they can transfer data twice as fast. In most cases they also have an address but which is more than 16 bits wide, so that they can reach more than 64K.

Memory and peripheral chips

For every processor sold, at least eight memory devices are sold too. Not suprisingly, therefore, this market is even more important to the manufacturers than that for microprocessor chips. Advances in technology have been very rapid. The 4Kbit chips which were available in the heyday of the 8080A became 16Kbit devices for the Z-80; now 64Kbits is the norm for new machines. Just around the corner are the 256Kbit chips able to exploit the addressing range of 16-bit processors like the 68000. Costs per bit are dropping dramatically to make large memory arrays an affordable proposition.

As the density of RAM memory chips increases, personal-computer manufacturers are able to offer higher-resolution graphics and more advanced software. In some cases the software need not be read in from floppy discs but can be resident in the machine, stored in ROM. The density of ROM devices is even higher than that of RAM. Even now 256Kbit chips are the norm, with 1Mbit not far off. Just think what you could do with 128K of software available as soon as you hit the On switch. As well as a fancy operating system like Unix, there would be room for a word-processing program, a spreadsheet and no doubt a few games too. It's quite an improvement over the 4K Basics of just a few years ago.

Also needed to build a complete system are the specialised peripheral devices. They are often just as dense and sophisticated as the microprocessors they serve. One of the most commonly used peripheral chips is the universal asynchronous receiver transmitter or Uart, which interfaces with RS-232 serial links for VDUs, modems and other external facilities. Devices of this type are available from the various manufacturers.

Graphics-controller chips are widely used to unload the tedious chore of screen refresh from the processor. Devices are now available which offer not only high-resolution bit-mapped colour graphics but the ability to draw lines and shapes without processor intervention. Add to these the extensive array of parallel interfaces, floppy-disc controllers, text processors, floating-point arithmetic units and memory managers, and you can see why there are often so many little black rectangles inside your office computer.

Each of these specialist chips is likely to cost as much as the CPU itself. At the lower end of the market lots of peripheral chips like these would soon have the price rocketing out of control. The designers of high-volume personal computers therefore turn to custom logic arrays. They are programmed at the manufacturing stage to form a peripheral chip tailored specifically for a particular machine and its needs.

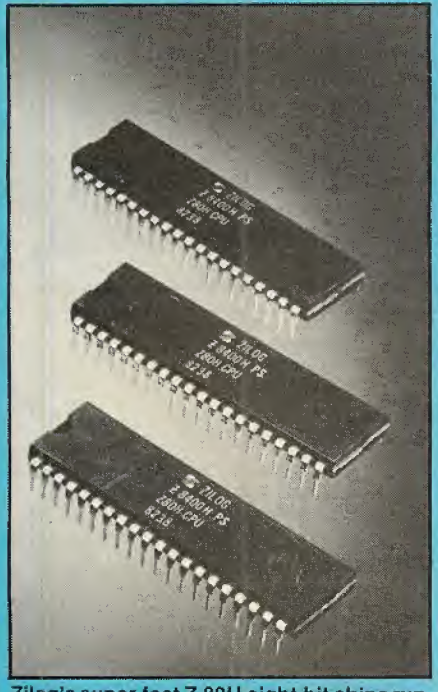
These cost-cutting devices provide only a subset of the general-purpose facilities offered by the conventional peripheral chips. But by clever design and compromise customised arrays can often be made to provide multiple functions such as dynamic-RAM refresh, graphics control and printer interface all from one package at a fraction of the cost of three separate chips. The use of these custom logic arrays means that there are relatively few components in mass-market home micros like the Sinclair Spectrum or Oric.

width internal bus. The memory addressing range is still 1Mbyte, but instructions and data are fetched from memory eight bits at a time. This slows down the processor of course, but it also allows it to be used with external memory and peripheral devices organised on a byte-wide basis, which in turn reduces the overall system costs.

The success of this ploy is plain to see. More 8088 processors have been sold than 8086s, and nearly all the first-generation 16-bit machines like the IBM PC and the ACT Sirius have used it. Better still, 8088 software is absolutely identical to 8086 software. System builders have a no-hassle upgrade path when they need it, which Intel has extended further to the 80186 and 80286 processors now available. In contrast, the more powerful Zilog Z-8000 processor family does not include an eight-bit bus version, which is one of the reasons why this otherwise attractive device has not caught on so well.

For the ultimate in 16-bit power, though, take a look at the Motorola 68000. This beautiful processor is designed with 32-bit architecture on the inside but uses a 16 bit bus to the outside world. If offers an elegant, regular instruction set and a 16Mbyte address range. The 68000 looks a natural for the second generation of 16-bit personal computers and has already been employed in advanced new machines like the Apple Lisa and others. An eight-bit bus version, the 68008, is available and the 68020 with a full 32-bit bus will be along soon.

On the following eight pages you will find details of the eight major families of CPU chip. They range from Intel's pioneering 8080A to the Motorola 68000 whose intricacies are giving the designers something to work on for micros that will be appearing in the second half of the decade.



Zilog's super-fast Z-80H eight-bit chips run at 8MHz.

Preparing silicon waters at Ferranti for ULA chips, key elements in cheap home micros.

Does it matter?

A few years ago, when personal computers were a brand-new phenomenon, any prospective buyer was made immediately aware of which microprocessor had been used to animate his or her new-found friend. Today the picture is changing, and in some cases one can comb the glowing text of the advertisements without finding so much as a hint of what the microprocessor chip is among the "128K" and "16-bit" superlatives. So should it really matter to today's prospective buyer what lurks within the oh-so-sexy box? The answer, as so often, is yes and no.

Any particular microprocessor chip can be compared with its contemporaries and a judgment made about its relative power or performance. Regrettably, the potential of that device may not be fully realised in the personal computers in which it is used, so it is better to compare personal computers on the basis of memory, word size, graphics capabilities, available software, and similar overall system parameters than to choose on the basis of the CPU chip used. Regular readers of this magazine have heard often enough about proud owners of new 16-bit machines who discover to their horror that programs actually run faster on their old eight-bit systems. Software is the great leveller, and bad 16-bit software is worse than good eight-bit code, no matter how big the price tag on the system.

But the choice of processor does matter because, by and large, different processor chips cannot run each other's software. If you choose a machine which uses an obscure processor you will find that software is difficult to come by, and expensive too. Happiness is definitely more assured if you go for the Ford Escort processor, rather than for that alluring Porsche with such great potential but so little support.

It also matters if the potential user intends to write any assembly-language software, since in this case the power and instruction set of the processor itself will be more important and more easily exploited. Finally, even if some of today's available software for 16-bit machines is mediocre, it is a fair bet that the situation will improve dramatically. The 16-bit machines do have much more untapped potential in terms of memory expansion and raw processor power, which will ensure that they remain useful for many years to come.

8080A The one that started it all

In 1972, when Intel introduced the first microprocessors, the 4004 and the 8008, the world had little idea of the revolution it was about to witness. They were puny devices with limited capabilities and instruction sets, and were fabricated in the difficult PMOS technology. These newcomers gave no hint of posing any threat to real computers, so most system designers looked briefly at the data sheets and passed on.

Within Intel itself, however, the possibilities opened up by a complete central processor on a single chip of silicon were soon recognised. Development of a more powerful successor using the new NMOS technology was vigorously pursued. The result was the 8080A, launched only 10 years ago as the leader of a revolution which was soon to affect us all.

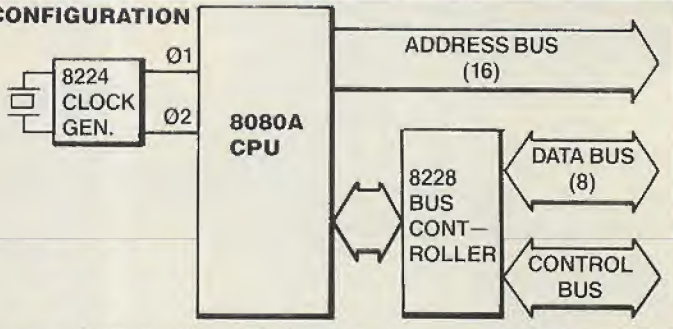
The 8080A was a real computer in miniature, with a 64K addressing range, a useful set of 78 instructions, plenty of registers, and binary or BCD arithmetic capability. Initially produced in small numbers and with a high price tag, the 8080A went on to sales exceeding two million units per year and made Intel almost a household name.

Right from the start visionaries foresaw its potential for use in small personal computers. The first real example, the Altair 880B, became so successful that its S-100 back-plane bus went on to become an industry standard. CP/M too, was designed for the 8080A, and is still the most popular operating system, offering access to a vast range of software. Intel's chosen successor to the 8080A, the 8085, was a damp squib by comparison, and attention soon switched to the Z-80 device from the competing Zilog corporation.

8080A

Manufacturers: Intel, NEC, AMD, National, Siemens, Signetics, Hitachi
Used on: Altair 880 and numerous other S-100 bus microcomputers
Technology: NMOS
Memory address range: 64K
Clock frequency: 2MHz
Power supply: +5V, +12V, −5V

BUS CONFIGURATION



ACCUM	8	Flags	8	PSW
B	8	C	8	BC
D	8	E	8	DE
H	8	L	8	HL
STACK POINTER			16	SP
PROGRAM COUNTER			16	PC

Register set
The 8080 has a single accumulator which acts as the implied focus of most instructions. In addition there are six eight-bit general-purpose registers which can be used as three 16-bit pairs, a stack pointer, a program counter, and a flag register. There are no true index registers.

Family members
Basic 8080A also needs 8224 clock generator or 8228 bus controller. Very wide range of peripheral circuits including serial Uart, parallel I/O, DHA, interrupt controller, keyboard encoder, etc. The 8085 CPU has same instruction set but improved bus and I/O.

Software and instruction set
The 8080A looks rather primitive today, but any system using CP/M runs code written for this processor since CP/M was originally developed for the 8080A. Thus a huge software base is available, including all popular languages and a host of special application programs. The instruction set is register orientated and contains 78 basic instructions including some BCD and 16-bit arithmetic types. A separate I/O address space is available using in and out instructions.

Z-80 Zilog's challenge

Shortly after the introduction of the 8080A, a group of engineers who had worked for Intel on that project broke away and formed the competing Zilog corporation. They had ambitious plans for a more powerful processor, and it was launched in 1977 as the Z-80.

The Z-80 is impressive even by today's enlightened standards; in 1977 it was a blockbuster. With two complete sets of 8080A-style general registers, two new index registers, on-chip dynamic-RAM refresh logic, three interrupt modes, and no less than 158 instructions including block operations, bit addressing, and BCD shifts, the Zilog Z-80 posed a real and sustained challenge to Intel.

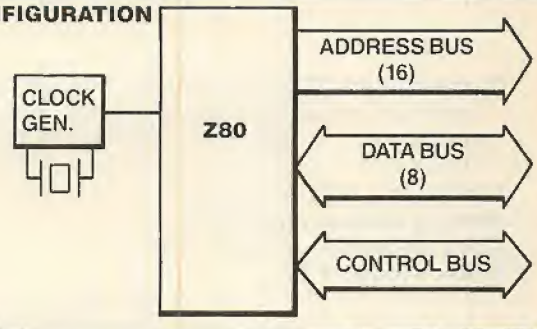
To cash in on the blooming 8080A market, Zilog made its processor upwards compatible at the object-code level. This endowed the Z-80 with a messy and confusing instruction set, but also ensured ready industry acceptance and access to the gigantic CP/M software base. To provide room for all the new instructions, Zilog took advantage of the 12 unused op codes in the 8080A set. Some were used directly, and others were trap doors to additional op-code tables, each with 256 new op code possibilities. This technique made it necessary to use two op code bytes to reach the new tables, and resulted in instructions up to four bytes long, but the wisdom of the Zilog approach to compatibility has been amply demonstrated by the sales figures.

Also introduced were a family of very powerful peripheral devices which used the sophisticated Z-80 interrupt structure; they are still considered the best devices of their type available. Used in many personal computers including all the Sinclair family, the Z-80 will be with us for many years to come.

Z-80

Manufacturers: Zilog, Mostek, NEC, Sharo, SGS
Used on: Sinclair ZX-80, 81 and Spectrum; Lynx; Tandy; Video Genie; Nascom; etc.
Technology: NMOS
Memory address range: 64K
Clock frequency: 2.5MHz or 4MHz
Power supply: +5V

BUS CONFIGURATION



A	8	F	8	A'	8	F'	8
B		C		B'		C'	
D		E		D'		E'	
H		L		H'		L'	
I		R					
INDEX REG			IX 16				
INDEX REG			IY 16				
STACK POINTER			SP 16				
PROGRAM CNTR.			PC 16				

Alternative register set
Either main set or alternative set can be used. Bank switch is achieved with EX and EXX instructions.

Register set
The Z-80 register set is very generous and has two banks of 8080-style general registers plus two 16-bit index registers. Also included is an interrupt page address register I and a dynamic-RAM refresh counter register R.

Family members
The Z-80 requires an external clock generator but does not need a bus controller. Zilog has a powerful family of peripheral chips including a PIO, CTC and dual Uart/SIO, each of which includes vectored interrupt logic; 8080 peripherals can also be used.

Software and instruction set
This processor is probably better endowed with available software than any other, thanks to upward 8080 compatibility and the CP/M operating system — and Clive Sinclair. The instruction set is much improved over that of the 8080 and includes extended 16-bit compatibility, relative jumps, indexed addressing, bit set, test, and reset, block operations, and BCD shift operations. There are 158 basic instructions.

6502 Commodore's Pet chip

Shortly after the introduction of the 8080A, Motorola introduced the MC-6800, a pretty chip with some nice features like single-supply 5V operation and an easy-to-use instruction set. Due in part to a lack of on-chip registers, the 6800 was never as popular as the 8080A and was not very good at running high-level languages like Basic.

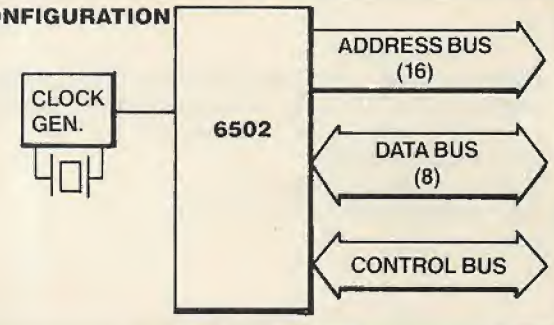
Once again, a small competing firm, in this case MOS Technology, decided it could do better, and the 6502 was born. It was optimised for data-processing applications and had the advantage of two index registers and a comprehensive set of addressing modes which, rather surprisingly, allowed it to run certain benchmarks even faster than the Z-80. The chip was simple and cheap, and right from the start it attracted the attention of budding personal-computer manufacturers.

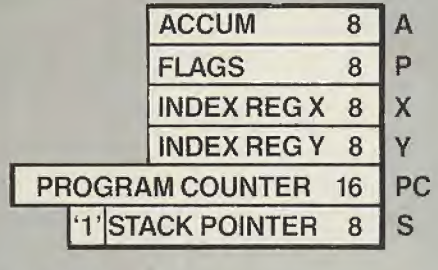
The very first single-box personal computer, the Commodore Pet, was designed around the 6502. It was hotly pursued by the Apple, and when MOS Technology ran into trouble Commodore took over and is now a fully fledged semiconductor manufacturer in its own right. Two aggressive second sources, Rockwell and Synertek, back up the field. The 6502 is actually only one device in a whole family of processors with the same basic architecture, including single-chip processors with RAM, ROM and I/O all in the same package.

6502

Manufacturers: MOS Technology, now Commodore Semicon Group; Rockwell, Sybertek
Used on: Atom, Apple, BBC, Commodore Pet, Vic-20, Oric, etc.
Technology: NMOS
Memory address range: 64K
Clock frequency: 1MHz or 2MHz
Power supply: +5V

BUS CONFIGURATION





Register set
The 6502 register set appears odd but it has been designed to provide maximum facilities from the minimum of silicon. Apart from the single accumulator there are no general-purpose data registers, but the whole of memory page 0 can be used for this purpose. The short index registers are enlarged by clever addressing modes but the short stack pointer mandates the use of page 1 for the stack.

Family members
The 6502 is just one member of a large family of closely related microprocessors which offer various features and address ranges. There is a large family of 6502 peripheral devices including Uarts, PIOs, CRT controllers and combination chips.

Software and instruction set
The 6502 has been chosen for many personal computers, which guarantees a broad software base. The Achilles heel of the 6502 is its incompatibility with CP/M and the lack of a universal 6502 orientated alternative OS. The instruction set is well thought-out and squeezes a lot of performance from a short set of 56 basic types, thanks to a large repertoire of addressing modes. The 6502 performs very well when running high-level languages — often better, than the Z-80.

6809 Best of the eight-bitters

When the 6502 stole most of the Motorola 6800 thunder, there was only one thing for Motorola to do and that was to build a new processor that was better in every respect. So dedicated were the Motorola designers to building the very best eight-bit device, that the resulting 6809 chip has just about everything that anyone could want from an eight-bit processor, except one thing: it was not around when it was really needed.

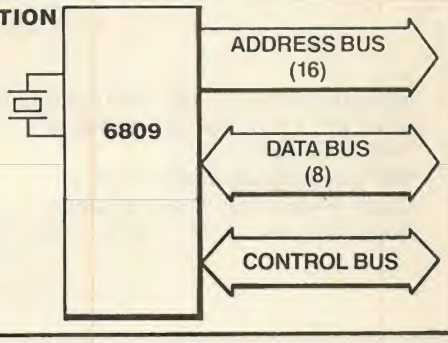
This elegant paragon of a microprocessor arrived on the scene too late to grab much of a share of the thriving eight-bit personal-computer market, and most designers had already opted for the Z-80 or the 6502 for their shiny new machines. The classic lines of the 6809 were enough, however, to ensure that some manufacturers would adopt it, and it has appeared in the Dragon, the Tandy Color Computer and a few others you may be lucky enough to own.

Like the 6502, the 6809 does not enjoy the undoubted benefits of CP/M compatibility, and so software availability is a problem. What software there is runs very fast on the sleek architecture of this powerful processor. With two accumulators, two index registers, two stack pointers, a host of addressing modes and a hardware multiplier, the 6809 does well in high-level language applications. It can be expected to Benchmark ahead of the Z-80 or the 6502 on most data-processing tasks. It will be interesting to see whether this chip manages to carve out its own niche in the microprocessor hall of fame before the coming deluge of 16-bit machines swamps the market.

6809

Manufacturers: Motorola, AMI, Fairchild, Hitachi
Used on: Dragon, Tandy Color Computer
Technology: NMOS
Memory address range: 64K
Clock frequency: 1.0MHz, 1.5MHz, 2MHz
Power supply: +5V

BUS CONFIGURATION



ACCUM A 8	ACCUM B 8	D
DIRECT PAGE	FLAGS	
INDEX REGISTER X	16	X
INDEX REGISTER Y	16	Y
USER STACK POINTER	16	LL
SYSTEM STACK POINTER	16	S
PROGRAM COUNTER	16	PC

Register set
The 6809 puts right the shortcomings of the 6800 and 6502 register set and is optimised for data-processing and high-level language applications. There are two stack points, two index registers and two eight-bit accumulators which can be concentrated to form the 16-bit D register. The direct page register allows the register page to be positioned anywhere in memory.

Family members
The 6809 has a companion device, the 6809E, which is optimised for multi-processor tasks. Since the 6809 bus structure is compatible with the 6800 and 6502, peripheral chips from those families are used for expansion: the special 6829 memory-management unit is also available.

Software and instruction set
The 6809 is ideal for personal-computer applications since it is optimised for data-processing tables. Unfortunately it has not been widely used due to its late arrival on the market, and the available software base is consequently restricted. The instruction set is regular, elegant, and powerful with lots of nice features such as the eight-by-eight multiply and extensive 16-bit operations. The additional stack pointer is useful for RPN maths and high-level language interpreters.

9900 First to 16-bits

The 9900 represented a bold move by Texas Instruments, one of the largest of the semiconductor manufacturers. In 1976, Texas announced that the 16-bit 9900 represented the "end of the two-bit eight-bit", but things are never that clear cut or predictable in the fickle microprocessor market. Despite plenty of early interest from scientific and military designers who needed the high throughput and 16-bit precision the 9900 offered, this unique device was too costly and too different to be used in the volume applications so essential for success. With separate 16-bit data and address buses, the Texas chip needed an expensive 64-pin package, but could only address 32K.

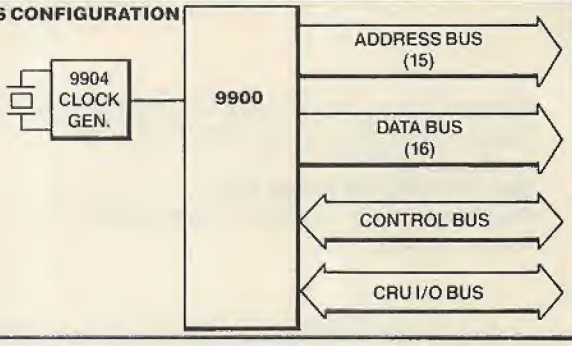
The architecture is based on that of the Texas 990 family of minicomputers and has many novel features, including the use of blocks of workspace registers in RAM memory rather than the more usual on-chip register sets of conventional processors. I/O arrangements are unusual too in using a serial communications register unit which can address up to 4,096 individual bit I/O lines. It is therefore possible for Texas to produce a family of peripheral devices using smaller packages than those used by the competition. But programming the 9900 requires a special approach since there are no stack operations and no JSR instruction.

To the initiated, however, the 9900 chip is powerful and flexible. To show what could be done, Texas introduced its own personal computer which used it, the TI-99/4. Unfortunately it has not proved a great success in the market place and is now being discontinued in favour of an 8088-based machine. More up-to-date versions of the 9900 are now available, including the 9995 with a multiplexed bus, and the 99000 which is intended to compete with the 8086 and 68000.

9900

Manufacturers: Texas Instruments, AMI, ITT
Used on: Texas home computer
Technology: NMOS
Memory address range: 32K
Clock frequency: 3MHz or 4MHz
Power supply: +5V, +12V, −5V

BUS CONFIGURATION



PROGRAM COUNTER	16	PC
WORKSPACE POINTER	16	WP
STATUS (FLAG) REGISTER	16	ST

Register set
The 9900 has a unique architecture which relies on multiple banks of workspace registers in RAM and therefore has few on-chip registers. The only on-chip registers are the program-counter flag register and the register which points to the current workspace. Multiple accumulators and index registers can be provided in the workspace, but there is no true stack pointer on the chip or in the workspace.

Software and instruction set
The 9900 is compatible with the Texas 990 family of minicomputers and can solve software with them, but there is no popular user base and no access to the huge variety of software offered by CP/M. The Texas home computer does, however, have a reasonable following and reasonable software. The instruction set is quite unique and does not include stack operations or subroutine jumps. I/O operations are also different from other CPUs and use the special serial CRU bus.

Family members
Several more recent variations of the basic 9900 architecture have been produced, including the 9940 single-chip device and the 9995 with a 40-pin package and multiplexed data bus. There is a useful family of dedicated peripheral devices.

8088 Minicomputer on a desk

Intel waited until large cheap memories were available and the market was ready before launching its own 16-bit processor, the 8086. Once again its timing was excellent. Designers liked the 1Mbyte address range and the powerful new instruction set. A memory system organised for a 16-bit data bus can be expensive however — too expensive for the personal-computer market to begin with — so Intel also produced the companion 8088 which uses an eight-bit data bus.

The 8088 is identical to the 8086 on the inside, and can run the same software; the only difference is the width of the external data bus. This slows things down, but has the more important effect of lowering system costs. The 8088 has been a big success in the personal-computer field, being used in the IBM PC and several other machines where it gives minicomputer performance in a low-cost desk-top system.

In a repeat of its earlier success with the 8080A, Intel has managed to gain a firm foothold in the 16-bit market with the 8088. Manufacturers are therefore likely to choose another Intel device, such as the 8086 or the newer 80186 or 80286, when the time comes to add increased performance to their products. The 8088/8086 family also has the two popular disc-operating systems CP/M-86 and MS-DOS to its credit.

Despite its success, the 8088 is not a very elegant chip. It has an untidy architecture and instruction set, and needs three separate chips for the CPU group alone. It is only the economics of its early popularity which keeps it ahead.

8088

Manufacturers: Intel, AMD, NEC, Siemens, Fujitsu
Used on: IBM PC, Sirius, DEC Rainbow, Texas Professional
Technology: HMOS
Memory address range: 1Mbyte
Clock frequency: 5MHz, 8MHz and 10MHz
Power supply: + 5V

FLAGS	16	

Register set
The 8088 registers and architecture are identical to that of the 8086 and contain as a subset a group of 8080 types. A 20-bit address is generated by combining a pointer and a segment register, four segments being simultaneously available. There are eight eight-bit general registers which can be used as four 16-bit pairs.

Family members
In Min mode 8088 just needs an 8264 clock generator, but in Max mode an 8288 bus controller is also required. The 8088 is an eight-bit bus version of the 8086 16-bit processor. Few-chip versions 80188 and 80186 are now available as is the 80286 virtual-memory version.

Software and instruction set
Its selection for the popular IBM PC and Sirius machines has meant there is more software available for the 8088/86 than for any other 16-bit CPU. Operating systems include CP/M-80, MS-DOS and Unix. There are no software differences between the 8088 and 8086, and both are upwards compatible with the 8080 at the object-code level. The instruction set is aimed at minicomputer-style applications in high-level languages and contains multiply/divide, bit operations and Z-80 style block operations.

68000 Beauty . . .

Motorola has always produced elegant processors. Its 6800, despite coming second to the 8080A, was much easier to understand and to program, and the 6809 is the best of all the eight-bit chips. With the 68000, though, Motorola has surpassed itself with a processor that is not only prettier to look at than the competition but is also a lot more powerful into the bargain.

While others use fancy extras and clever tricks to squeeze extra performance out of their chips, the secret of the 68000 lies in the sheer scale of its internal 32-bit architecture. With 17 32-bit registers, a 16-bit data bus and a 24-bit address bus, the 68000 does not need tricks to get performance. The programmer is faced with a simple set of only 56 basic instructions which can be expanded by data-type and address-mode options to provide over 1,000 combinations.

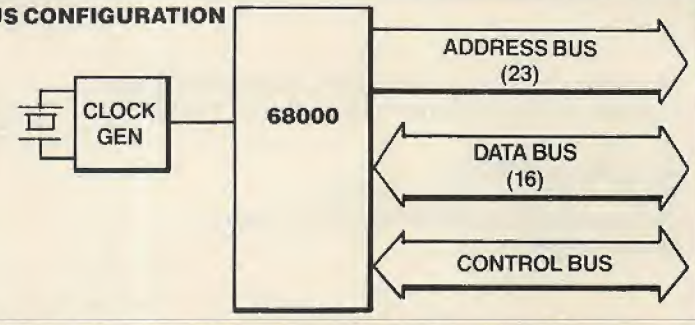
The 68000 is powerful enough to take advantage of the much favoured Unix operating system from Bell Labs, which is fast becoming a standard for 68000 users. Unix offers the same advantages that were ultimately achieved by CP/M on the 8080 and its derivatives — a common software base.

While the 8086 needs lots of awkward add-ons to squeeze more performance from it, as in the new 80286, the 68000 is really a more powerful machine struggling to escape, and so upgrades are simple. Next to appear will be the 68010, still with a 16-bit data bus but offering virtual-memory support. After that we are promised the 68020, which reveals for the first time the full glory of that 32-bit architecture.

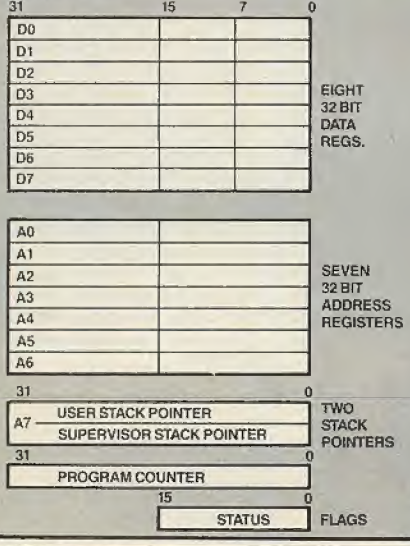
68000

Manufacturers: Motorola, Mostek, Rockwell, Signetics, Thompson CSF
Used on: Apple Lisa, Torch 700, HP 9826
Technology: HMOS
Memory address range: 16Mbyte
Clock frequency: 4MHz, 6MHz, 8MHz, 10MHz, 12.5MHz
Power supply: +5V

BUS CONFIGURATION



Register set



Family members
At the moment there is a shortage of 68000 peripheral devices and no maths processor but 6800/6502 peripherals can be used. Other processors available or planned are the 68008 eight-bit data bus, the 68010 with virtual-memory support and the 68020 with full 32-bit data bus.

Software and instruction set
The 68000 is a very powerful processor and will probably become very popular as new systems are introduced. The most popular operating system at the moment is Unix in several versions. Available software is fairly limited at the moment but the situation will quickly change as support grows. The instruction set is powerful, simple and elegant, being based on just 56 basic mnemonics. Surprisingly, the 68000 can perform floating-point arithmetic almost as fast as the 8086 with 8087 co-processor.

Z-8000 . . . and the beast

The Z-8000 appeared after the 8086 and before the 68000 and has unfortunately turned out to be neither first nor best. A processor very much from the Zilog mould, the architecture is designed for raw processing power with no concessions to the seekers of elegance or simplicity. The Zilog motto seems to be: if it's any use, stick it in. As a result, this admittedly powerful device is the most complex 16-bit processor around, having 110 basic instruction mnemonics and an extensive but tangled register set. But despite the complexity, it actually uses fewer transistors on the chip than the 8086 because it uses logic for instruction decoding rather than the simpler but more wasteful microcode of its competitors.

One of the Z-8000's features, inherited and expanded from the similar Z-80 facility, is an extensive set of 20 block or string macro instructions able to move, compare and translate whole blocks of memory in one go. One of its biggest disadvantages, on the other hand, is the fact that no eight-bit bus version has been produced, effectively keeping the door firmly closed to use in pioneering 16-bit personal computers. Up to now, the Z-8000 has been most successful in military applications, but Commodore has recently announced its intention of using it in a new machine, so perhaps it is not too late. The label Z-8000 is a family name for the Z-8001, with 8Mbyte addressing, and the Z-8002 which addresses 64K. There is no Z-8000 chip as such.

Zilog itself seems to be having second thoughts, because it has launched an entirely separate 16-bit processor, the Z-800. It has the great advantage of being upwards compatible with the Z-80, which the Z-8000 is not.

Z-8000

Manufacturers: Zilog, AMD, SGS, Sharp, Toshiba
Used on: Zilog System 8000, newly announced Commodore system
Technology: NMOS
Memory address range: 8Mbyte
Clock frequency: 4MHz, 6MHz, 10MHz
Power supply: +5V

Register set
The Z-8000 has plenty of general and special-purpose registers, but the programmer has a lot to remember. Register combinations of eight, 16, 32 and 64 bits are available.

Family members
The Z-8000 family includes: the Z-8001, 48-pin, 8Mbyte; Z-8002, 40-pin, 64K; and the Z-8003 and Z-8004 with virtual-memory support. There is an extensive family of peripheral chips including a maths unit, memory manager, and a universal peripheral controller.

Software and instruction set
The Z-8000 has not caught on in the personal-computer market despite its power and availability so software support is limited. A version of CP/M called CP/M-8000 is available; as yet there is little software to run under it but this may change when Commodore introduces its promised machine using the Zilog chip. The instruction set has 110 basic mnemonics and many advanced features, including comprehensive string and block functions. Unfortunately, it is also rather messy.

Micro Business

National Exhibition Centre, Birmingham. May 4–7, 1984.

After one show the Midland Computer Fair has already established itself as an outright winner. Not only is it the leading exhibition in the Midlands for microcomputers and related products, but it stands in its own right as a major national event.

In recognition of this, and the need to accommodate thousands of expected visitors the venue for the 1984 Midland Computer Fair is to be Britain's premier showcase – the National Exhibition Centre, Birmingham. The NEC with its superb facilities for exhibitors and visitors alike will be the fitting site for this major event which attracted over 17,000 people for the first show.

Whether you are interested in microcomputer enthusiasts or would prefer to take space in the Business Section to meet small business micro-users, the Midland Computer Fair is definitely for you.

So why not let a little of the Midland Computer Fair's success rub off on your company by reserving a stand at the next show.

The road to success starts by filling in the coupon below:

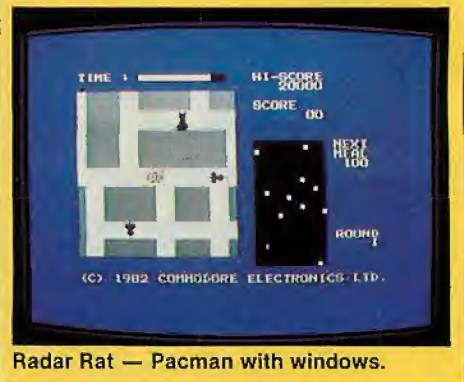
How to score with the 64

Games on the Commodore 64 are noisy and colourful, but its capabilities are only just beginning to be exploited, as Paul Bond discovered.

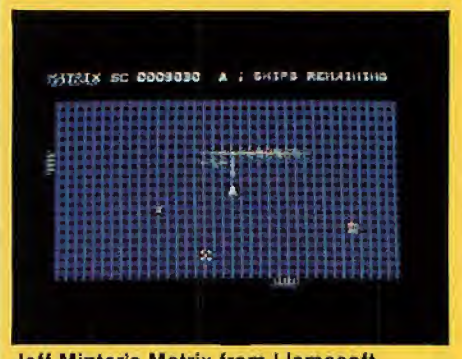
Outstanding graphics are a feature of Commodore's forthcoming Soccer.

Mirrorsoft's Caesar aims to keep the larder mouse-free.

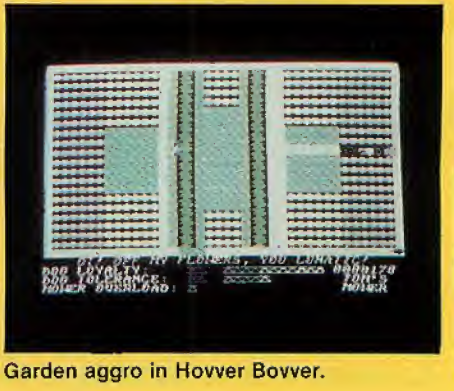
WITH ITS elephantine 64K of memory, nearly 38K of which is available for Basic programs, and a choice of 16 colours, together with the impressive sound capability of the Sid chip, the Commodore 64 is ideal for home use. On the minus side, its Basic is slow. The machine's potential may be further extended by the adition of the new Simons Basic, but this may be a pricey privilege.



Radar Rat — Pacman with windows.



Jeff Minter's Matrix from Llamasoft.



Garden aggro in Hovver Bovver.

Blue Moon

Like the song *Blue Moon* , the Merlin Software game of the same name is an old standard: you shoot at things coming down the screen. Nevertheless, the game has some originality in its interpretation.

You take the part of the pilot of an intergalactic spacecraft, and have to rescue another spacecraft then return to the safety of the Blue Moon. But before you can get any ground elapsed time under your belt you have to dock with the other half of your ship. There is nothing so infuriating as having to carry out this kind of delicate operation before you can get down to laying waste vast regions of the cosmos. But it is intensely satisfying, seconds later and docking achieved, when you are catapulted straight into a comet storm. You have to dodge them if you want to have any future in the Space Corps, and it won't do your score any harm if you put a few ergs into these irritating ice blocks.

Presently the blue bouncers appear and bounce around the screen firing plasma bombs. They can mutate into pods and fall to the bottom of the screen. Occasionally the Tecom Man drifts across the screen dropping droids and large yellow eggs containing bell birds. They are pretty handy with the old plasma bombs too.

You have to zap the whole sorry crew before you delta-vee down to the lunar surface, where you have a choice of difficult and easy landing sites.

Blue Moon is a good example of how traditional games are implemented on the 64 — not original in concept but visually appealing and addictive if you like shoot-em-up games. It is certainly fast.

Matrix

Still in space, and travelling faster than before, we approach the fine-mesh tracery of the Power Grid surrounding planet Earth. Llamasoft's Matrix, implemented by Jeff Minter for the Commodore 64, is the true son of Gridrunner. Minter's original game is claimed to be number 7 in the American popularity stakes. The follow-up is set 10 years after the infamous Grid Wars when space pilots with nerves of steel battled to free the Power Grid of alien infestation.

In Gridrunner the evil droids traversed the grid horizontally; now they come in diagonal waves too. In the original game the X,Y zappers running along two sides of the grid formed pods at the nodes of their crossfire. If you were not caught in the crossfire, the pods would probably obliterate you by hurling a bolt of energy down the grid. It's the same in Matrix, but there is a treacherous humanoid, the Snitch, who runs along the top of the grid pointing you out to the enemy. Camels appear and run down the grid, reducing your score, and force fields hurl your fire back at you. On the plus side, ship control — achieved by joystick — no longer limits you to the lower regions of the grid; you can move anywhere other than the top four lines.

There are 20 skill levels. The first six are selectable before play and after that you must fight. Action is incredibly fast and furious throughout, and the interminable sounds of cosmic weaponry are well reproduced by the Sid chip. This is essential, if only to drown out the demented screams which people playing this game inevitably emit.

Hovver Bovver

Back to the green hills of Earth. Since most surviving grid pilots are good for little other than mowing the lawn, it is fitting that we should move on to another Minter extravaganza, Llamasoft's Hovver Bovver.

It is summer-time in England. Gordon Bennet presumes too much and borrows his neighbour Jim's Air-Mo. But Jim decides he wants his mower back.

The scene is set for a horticultural holocuast in which, using the joystick to manoeuvre Gordon and his mower, you run away from Jim at the same time as your dog Rover fights a rearguard action, snapping at Jim's heels. However, Rover is frightened of the Air-Mo, so monitor Dog Tolerance and Dog Loyalty readouts carefully. If you slice through a flower bed, an angry gardener will join in the chase. The game has 16 different lawns, including one shaped like a llama. As with Matrix, the graphics are good but the sound-track is particularly telling. Mowing, screaming, snapping and barking are well reproduced and a non-stop rendition of *In an English Country Garden* churns on and on.

Caesar the Cat

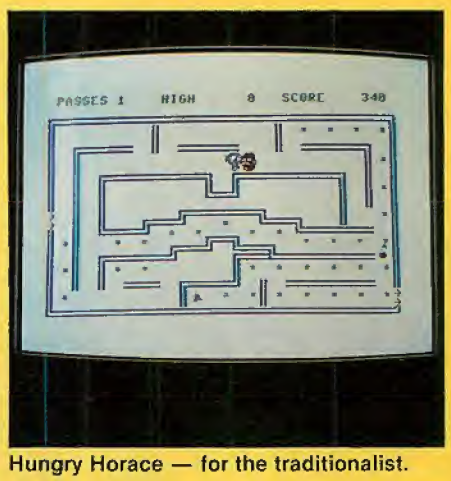
From Rover the dog to Caesar the Cat, Mirrorsoft's cute game for the Commodore 64. Mirrorsoft is part of Mirror Group Newspapers and you can buy the software via MGN publications or from newsagents, plus the usual commercial outlets. If Caesar is anything to go by, MGN has avoided the mistakes made by some other big companies seeking to break into the home-computing software market.

Caesar is a cheeky young cat on duty in a well stocked larder. There is a joystick/keyboard control option, which you use to guide the furry feline along crowded shelves to pounce on the mice and take them away from the larder through a door which appears at random.

With its Disneyesque graphics and

(continued on page 121)

Grandmaster — the strongest yet?



Hungry Horace — for the traditionalist.

Supersoft's innovative Stix.

You are Bilbo Baggins in Melbourne House's flexible adaptation of J R R Tolkien's tale *The Hobbit*.

A new printer from Epson for letter quality and speed. LQ-1500.

Epson have now launched the LQ-1500 that gives you the best of both worlds, the speed to get the information on paper fast and high quality print you'll be proud of.

The LQ-1500 is a totally new breed of printer. A dot matrix machine capable of 200 CPS in draft mode, which can also be set to produce letter quality at 66 CPS by simply flicking a switch.

Like all Epson products, versatility has been a primary consideration of the LQ-1500, incorporating friction feed as standard with optional tractor and hopper feed, and carriage width of a full 15".

You now have at your finger-tips all the advantages of a daisy-wheel machine, in terms of quality, together with the added benefits of condensed or enlarged characters and proportional spacing, plus a very high speed when set to operate in draft mode.

Having superb graphics capabilities and optional 8 bit parallel (centronics) RS-232 and IEEE interfaces, the LQ-1500 has joined the Epson family of very fine printers.

EPSON

Extraordinary product.
Exceptional quality.

● Circle No. 161

(continued from page 119)
catchy backing music, the game should appeal to youngsters, but it is also challenging for high-scoring arcade adepts. The concept of keeping the larder free of mice, especially when portrayed so well, seems healthier than murdering encroaching hordes of presumably sentient alien beings. The game is a really excellent use of the Commodore's graphic facilities.

Radar Rat Race

Now from cats to rats. This cartridge-based program seemed the most promising of the bunch. Cartridges cost more than cassettes, and a lot of the games tested did not seem to merit the extra expenditure for the sake of quick loading.

Radar Rat Race, from Commodore, is like a speedy Pacman with windows. As a rat, you race through a continually scrolling maze, pursued by red rats and trying not to bump into cats sitting about in the passageways. If a rat is hot on your trail you can create a false scent by pressing the S key. On the right-hand side of the screen is a small plan of the entire maze, from which you glean where the cheese is hidden. There are 10 cheeses placed throughout the maze. The first is worth 100 points, the second 200 and so on.

There is a joystick/keyboard option and scoring more than 20,000 gives you an extra life. Radar Rat Race was not one of my all-time personal favourites, but it will appeal to maze addicts.

Hungry Horace

Remaining with mazes, we find the voracious Horace — Melbourne House's variation on an Atari theme — still in the park eating flowers and stealing the guards' lunch. The game also scrolls: the park is divided into four sections, each with an exit. Horace exits when he likes, and doesn't have to clear the screen. Each area of the park is tougher than the last. On leaving the last section, you re-enter the first with the action becoming faster and the guards meaner.

This implementation is fine if you are a traditionalist, but hopes remain high that games like this will have more life injected into them in future. Most software houses have so far failed to utilise the extra memory of the 64 to its full extent.

Stix

Atari-like insofar as it bears a passing resemblance to a game called Qix, Stix from Supersoft has a scenario in which a bundle of energy roams the universe, destroying all in its path. It becomes trapped in a cosmic storm, giving you the chance to harness its evil power for the good of mankind. To control the energy you must restrict its movement by constructing force fields.

This you do by moving four field synthesisers around the screen using your joystick plugged into control port 1. A field can be completed by joining to the boundary of the screen or to another completed force field. If you keep the Fire button depressed, it takes longer to finish a border, but you do score more. When more than 75 percent of the hyperspace has been surrounded by force fields you move into a new dimension and each percent scored above 75 percent scores more points.

A game of strategy, Stix is one of the more original computer games around and its implementation for the 64 has not done it any harm. Mondrian would have loved it.

The Hobbit

Originally implemented by Melbourne House for the Spectrum, this is a computerised Adventure game. It is based on Professor Tolkien's famous yarn about a hairy-footed little creature in conflict with a nasty dragon. Your role is that of the feisty Bilbo Baggins — to discover the evil dragon Smaug and recover the treasure. The delinquent orcs and poor Smeagol cause as much trouble as possible. Help is sometimes available from Gandalf Greyhame, but don't rely on it.

Each different scene in the adventure is colourfully depicted on the screen. Commands can be entered with a great deal of flexibility since the program has a large vocabulary. It recognises over 500 words, and can perform over 50 different actions made up by over 30 verbs, combined with about a dozen prepositions.

Flexibility combined with excellent graphics account for the success of the Spectrum Hobbit. It should be as popular in the Commodore 64 version.

Grand Master

Supposedly the world's strongest chess program yet for home computers, Grand Master was developed by Kingsoft and is distributed by Audiogenic. To begin with you see a chess board with your white pieces, nearer the bottom of the screen. Moves are entered by locating the square from which you wish to move, followed by the square you want to move to, then pressing Return.

The Grand Master displays its thoughts in the form of plys. A ply is one move for one side. If you look to the letter P, you can see how many plys deep the analysis is. So P3 means that the program has analysed one move from itself, one from you, and its own again.

If you key in an illegal move, the computer will not accept it, so the program is a useful chess tutor too. You can have response times from five seconds up to several days, the latter for postal chess. Since the original version of this game will run happily on a Vic-20, perhaps we can look forward to an even stronger program in the future.

Soccer

Leaving the rarified intellectual atmosphere of the chess competition I donned my Pierre Cardin football-terrace-chic pullover and had a quick kick around with the Commodore three-dimensional football game.

The game stands alone as an example of what can be done with the 64. Brilliant graphics show the players from a BBC camera angle. You can select the colours you wish to play in. Two people can play using a pair of joysticks. At any time the man nearest the ball is under joystick control. There is an option enabling you to play against the computer but, as usual, it cheats.

There are some nice touches, such as the way the players troop off at half-time. The ball even casts a shadow, and makes a realistic boinking noise as it bounces around. But as any footballer will tell you, it's the roar of the crowd that makes it all worthwhile.

Game	Publisher	Price	Rating
Blue Moon	Merlin Software	£6.50	14/20
Matrix	Llamasoft	£7.50	15/20
Hovver Bovver	Llamasoft	£7.50	16/20
Caesar the Cat	Mirrorsoft	£8.95	17/20
Radar Rat Race*	Commodore	£9.99	12/20

Soccer	Commodore	TBA	18/20
Hobbit	Melbourne House	£14.95	16/20
Hungry Horace	Melbourne House	£5.95	13/20
Stix	Supersoft	£7.78	14/20

*Radar Rat Race is supplied on cartridge

Why all other spread

In the early days of micros, the first spreadsheets appeared, using complicated cell co-ordinate references to define plans.

This made the most of limited computing power but plans were tricky to write, and difficult to read later.

Today's micros are much more sophisticated but all the spreadsheets are more or less the same as they always were. All that is, except PlannerCalc and MasterPlanner. Described in a recent university report as "... the best spreadsheet package currently on the Market," PlannerCalc and MasterPlanner are true business aids.

Dyed in the wool calc freaks won't like them but businessmen will.

NEW USERS START HERE

PlannerCalc at £85.00* is now accepted as the first choice for people new to financial planning.

Designed for 8-bit micros, it boasts the kind of features that you'd expect to pay twice as much for. (Buy PlannerCalc's nearest rival and you'll have to.)

Unlike all other 'calc' products it allows you to enter calculations in a language you understand. Plain English.

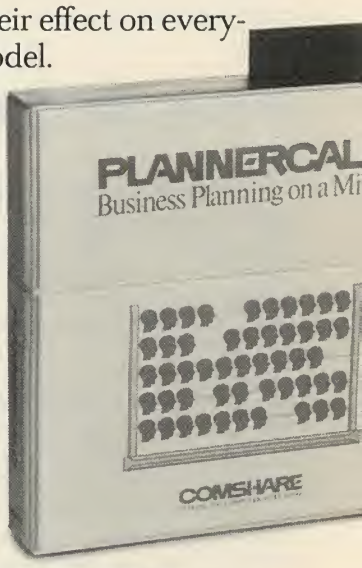
For example:

LINE 1 SALES=100, 150, 175, 210
LINE 2 EXPENSES=GROW 70 BY 15% FOR 4
LINE 3 NET=SALES−EXPENSES
LINE 4 CSALES=CUM SALES
COLUMN 5 YEAR=SUM OF COL 1 THRU COL 4

So it's much easier to use.

It uses the popular "spreadsheet" approach with a window that can be rolled in all directions.

Which means you can enter new figures and rules and immediately see their effect on everything else in the model.



It comes with the best manual on the market and it's suitable for most micros with a ™CP/M 2.2 operating system, 64K of memory, giving at least 900 cells, minimum screen width of 80 characters and 2 floppy disc drives.

MUCH MORE POWER, NOT MUCH MORE MONEY

MasterPlanner is the most powerful spreadsheet system currently available with its increased matrix size, 2000-3000 cells on most 64K micros. (But at £245* it certainly isn't the most expensive.)

Consolidation of models, allows you to create separate plans for each department and then combine them into an overall company

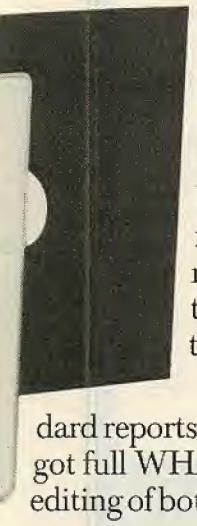
sheets are out of date.



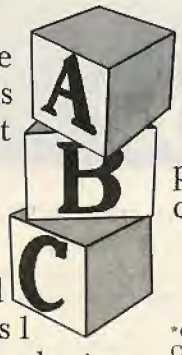
plan. Data transfer to word processing and other systems lets you incorporate figures in reports and output to a data base. It also has extensive formatting facilities which means you can produce reports that wouldn't look out of place in the board room.

It can store up to 25 standard reports to run when you need them. It's got full WHAT IF? analysis and direct editing of both spreadsheet and logic display.

JUST AS EASY TO USE

All this increased power doesn't mean you'll need a degree in advanced computing to understand MasterPlanner.

It works on exactly the same system as PlannerCalc and models written on PlannerCalc run without modification on MasterPlanner.



16 BIT VERSION

A new version of MasterPlanner has been specifically designed for the 16 bit micros like the Sirius 1 under ™CP/M-86 or the IBM personal using either CP/M-86 or ™MS DOS 1.1. With a vast matrix size of over 7000 cells on 128K and even more with larger memory, you'll at last be able to make the most of your micro.

ULTIMATE POWER

Fastplan is the top Comshare micro planning system.

It's file-based, allowing development of large scale models; with a staggering 18,000 cell matrix; full financial functions plus backwards iteration, file input and output; and much more. Yet, because it can be menu driven it is easy to use. For the full story, tick the Fastplan box when you return the coupon.

OVER 10 YEARS EXPERIENCE

When you invest in MasterPlanner or PlannerCalc you're not just getting the best software money can buy.

You're also getting the kind of back up and after-sales service that only a company of Comshare's track-record can guarantee.

If you'd like to know more about any product, call in at your local dealer or fill in the coupon and send it to us. *Plus VAT and post & package.

The new Argus
Above all, a true

Pro-personal. 16-bit computer.

On performance alone, the new Argus Pro-personal computer is way above the rest.

It's a true 8086-based 16-bit machine. And it's fast–8MHz.

Our Argus Pro-personal also gives you a choice of backing store from floppy right up to big Winchesters, and memory up to 896K.

So you've got the capacity and speed for professional-sized programs, and that means savings in expensive professional time.

A New World of Software

Running industry-standard CP/M-86†, the Argus Pro-personal opens your door wide to a vast array of 16-bit application software.

Ferranti also supplies software packages for major applications such as word processing and spreadsheet calculations. Of course the Argus Pro-personal can also run your existing 8-bit software.

It adds up to all the power and capacity you need. Benchmark tests have proved it outperforms its competitors.

A Complete Package Puts You One Up

Right from the start the Argus Pro-personal gives you what you want. CP/M-86† and BASIC are included. So is 128K of memory–and it's all available to you because the VDU has its own memory for both alphanumerics and high resolution graphics.

Check this out against the competition.

A Computer with the Human Touch

For all its professionalism, the Argus Pro-personal computer is easy to live with. It's user-friendly in every way. Compact and good looking, with clear characters on an anti-reflective screen. The VDU tilts and swivels, and the keyboard, VDU and processor box can be placed to suit the operator.

CP/M-86† is menu-driven so it's easier to use.

If You're Launching an Automated Office

The Argus Pro-personal with the rest of the Ferranti office product range allows access to mainframe computers, so if you want it to be part of a general office automation scheme, there's no problem.

You're on Firm Ground with Ferranti

Behind the Argus Pro-personal computer, a product at the leading edge of a fast moving technology, is a company with over 20 years in the computer business.

Ferranti has an unsurpassed reputation for quality assurance and reliability.

So, your investment is protected for the longest possible time. And you get a first-class maintenance service to back it up.

For a high-flying computer the Argus Pro-personal price tag is remarkably low level.

It starts at just £2,800.

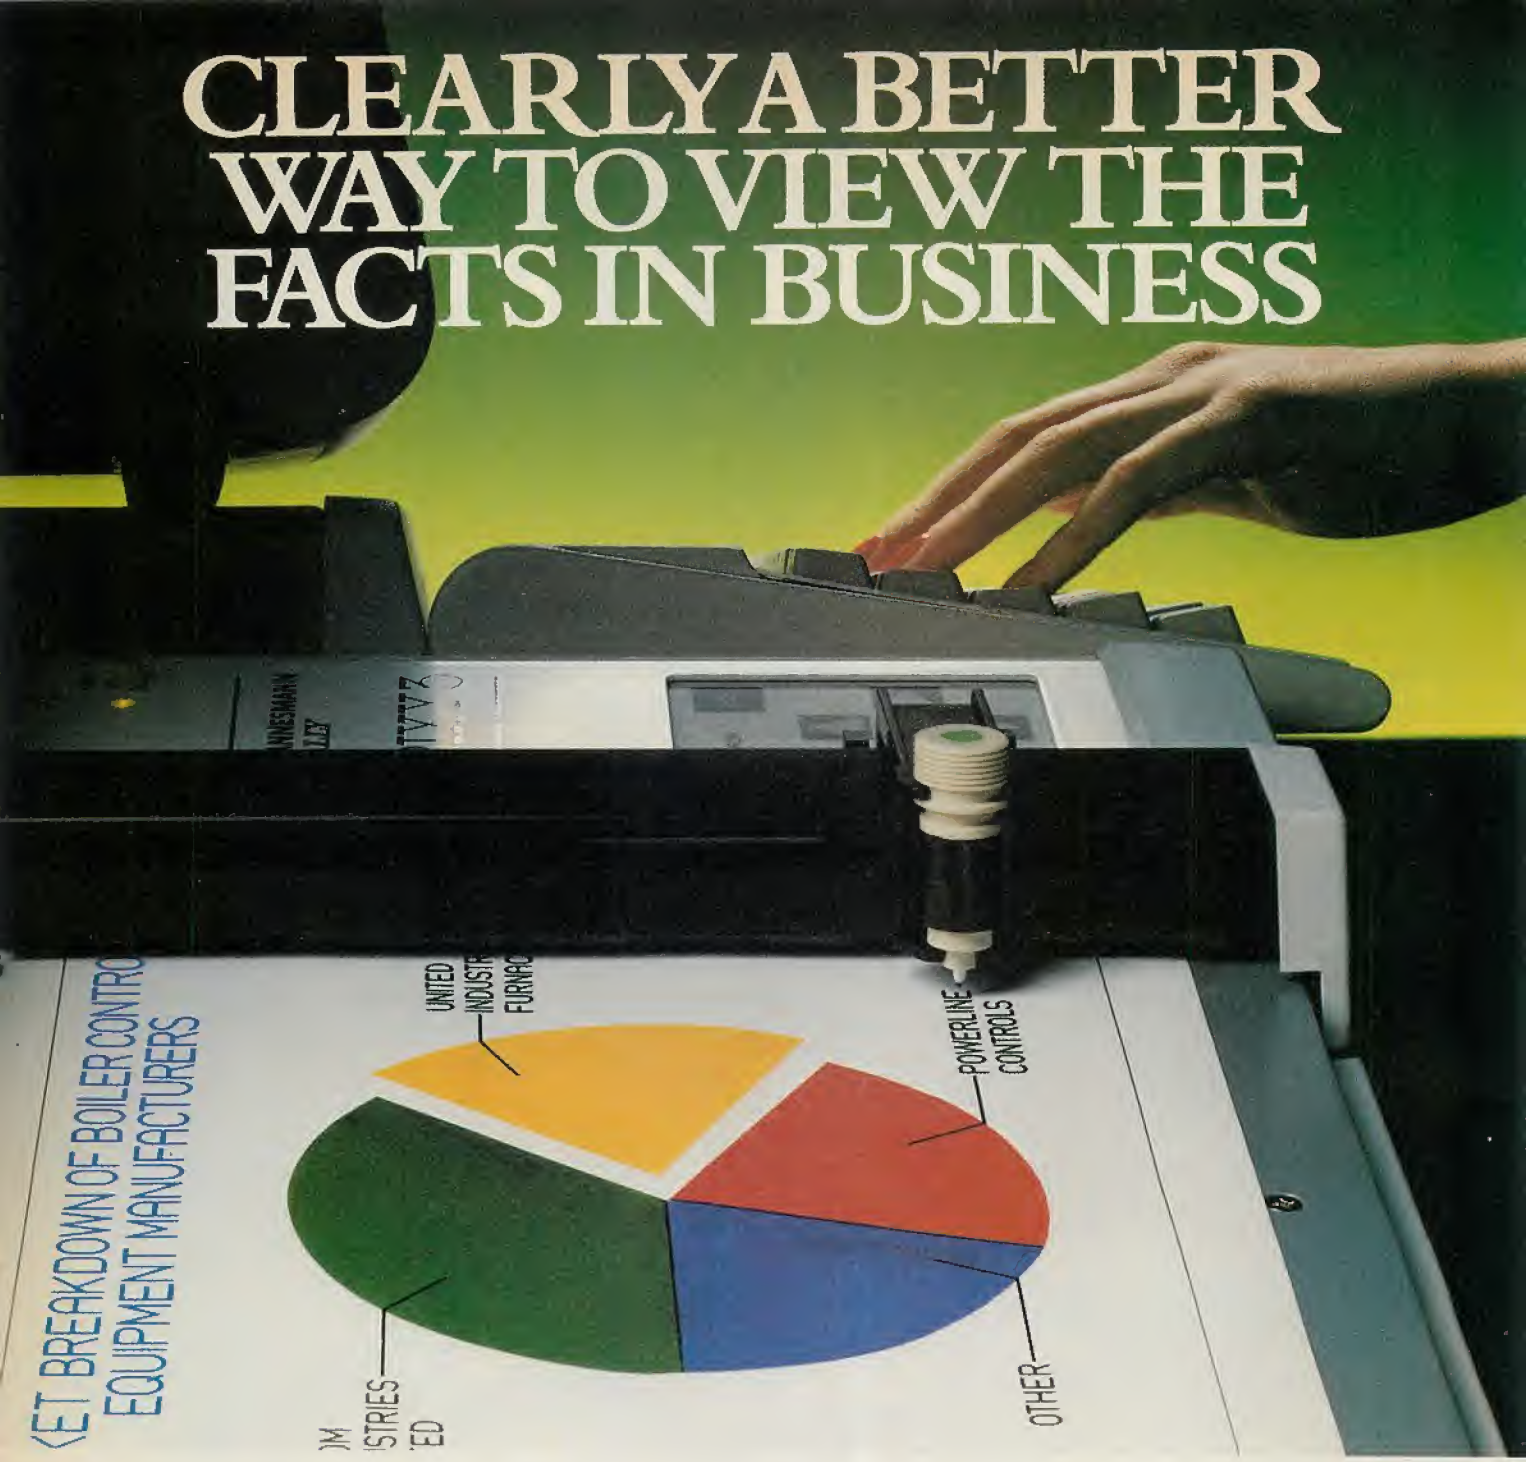
CLEARLY A BETTER WAY TO VIEW THE FACTS IN BUSINESS



Now you can transform even the most obscure facts into high-quality, multi-colour A4 sheets or overhead projection transparencies, making the Pixy Plotter the ideal aid for all kinds of business presentation.

With the new 3-pen Pixy Plotter you can turn your facts and figures into meaningful pie charts, flow charts, bar graphs, even circles, arcs and spirals easily and quickly.

And with the automatic pen change you can achieve up to 8 brilliant colours to create an extra dimension for reports and presentations.

With its sleek, compact design, it's the ideal companion for any popular desktop micro, only requiring standard available software to drive the plotter.

Its low cost now puts professional quality plotting within the reach of even the smallest of businesses.

There's never been a better way to put colourful pen to paper (or film).

Why not get a fuller picture of what the new Pixy Plotter can do, from your nearest distributor or send for our free colour brochure.

Open File is the part of the magazine written by the readers of *Practical Computing*. All aspects of microcomputing are covered, from games to serious business software and utilities. Fully-debugged programs can be submitted for any micro, and for standard CP/M machines such as the Osborne and Superbrain. Programs can be in machine code or any language, including Forth and Pascal.

Submissions should include a brief description which explains what your program does, and how it does it. If possible it should be typed, with lines double-spaced. We need a printed program listing. Hand-written listings cannot be accepted. A tape or disc of the program helps if it is in a standard format.

When printing listings, please remember to use a new ribbon or double-intensity printing — faint listings reproduce badly. Use plain paper only, and try to list the program across either a 35-character or a 70-character width. Also, make sure all special graphics or inverse-video characters are either listed correctly or else include Rem statements to explain them fully.

Each program listing, tape or disc must have your name and address on it, or we cannot promise its safe return. A stamped addressed envelope is appreciated.

If you write in with a comment, correction or enquiry please remember to state the machine and the program title.

We pay at least £10 for any programs used, or £35 per page and pro rata for part pages.

130 SENSATIONAL SIMON An implementation of the well known memory game.

130 CALCULATOR In John Humphreys' arithmetical puzzle the computer provides the numbers while you guess which operators link them together.

>COMMODORE

137 TRANSFERRING PROGRAMS Mike Todd's programming guidelines and Basic patches will help you convert Pet software for use on the Commodore 64.

137 CATALOGUING DISCS L V Turner's compact utilities, suitable for both Basic 4 and Basic 2, catalogue your disc files.

138 BOMBING MONSTER This arcade game illustrates Vic-20 graphics-programming techniques which help add that touch of excitement.

>NEWBRAIN

139 SCREEN DUMP A Atkins' routine demonstrates how to address memory for the currently open screen.

139 CARD INDEX Search through a set of electronic record cards and print the result.

139 RENUMBER The absence of this useful function can be remedied with A R Armitstead's routine.

140 BRAIN-MAN A fast and furious combination of maze, monster and power pills.

>SHARP

145 HIDDEN LINES How program lines may disappear from a listed program, but be implemented by the interpreter when the program is run.

145 THE NULL-INPUT PROBLEM Pressing Return in response to the Input prompt can make a nasty mess of carefully formatted screen output; this routine keeps things tidy.

>TANDY

146 GRAPH PLOTTER This Basic program will plot from Data statements or tape or disc files.

146 CODE BREAKER A logic puzzle after the classic Mastermind game.

>APPLE

149 SHOOT-OUT Dodge the approaching invaders in D Turnbull's game.

150 SCREEN FORMATTER Save instructions or text as binary files to be formatted for display.

>ATARI

152 DISC SAVER With H M Hoffman's routine you can recover a deleted file.

152 PAINTER Chris Simon's maze game requires 16K of RAM and a joystick.

>SINCLAIR

155 SCRUBBER How to reserve space and load machine code.

155 VOCABULARY Test your knowledge of a foreign language.

THE COMMERCIAL memory game Simon has been capturing young people's attention. The idea is to repeat a sequence in which the computer plays a series of notes while lights flash in four coloured boxes, each of which corresonds to a particular note. The player uses the cursor keys to simulate the pattern.

Each time the sequence is completed correctly one note is added to the length. If you can get as far as 20 notes then you are doing pretty well — though I do know someone who has got as far as 33 notes.

Calculator

So-called calculator programs can either be calculator simulators or fun programs where you have to guess the correct answer to a number of questions. J Humphreys' program is of the latter type.

The only restriction on how many questions you may be asked is the number that will fit on a screen, in this case 20. You have all the usual options of addition, subtraction, multiplication and division. When you have guessed all that you feel able to, you are presented with a score as a percentage, and a congratulatory word.

On the whole this is quite an enjoyable little program. Its screen presentation is let down only by the white on yellow prompts.

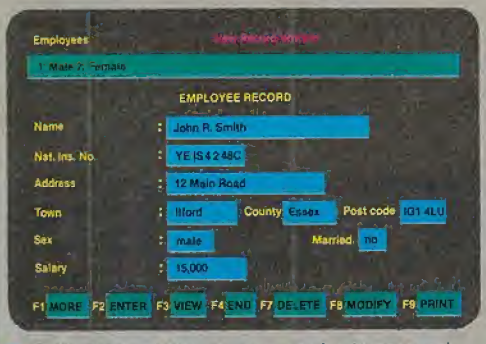
DATA MASTER

AT LAST – a database designed to let **you** organise your business the way **you** want it!

So easy to use you'll start using it in minutes



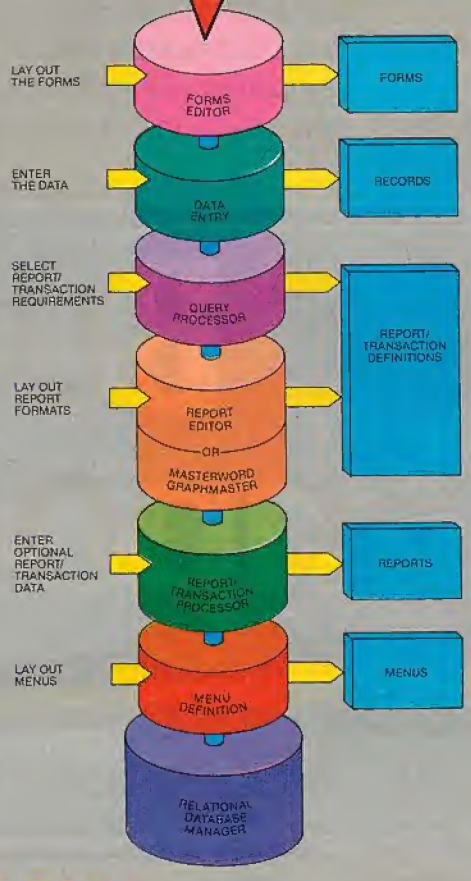
- *Fully menu driven to remove the guesswork.*
- *Full use of function keys with the assignments always displayed. All cursor movement and editing functions on the keyboard are supported.*
- *Provides full colour support and screen style customisation.*

System Features:

- *A list of users can be kept, with passwords and security levels.*
- *The print style is customisable.*
- *Data can be interchanged with mainframe computers, other databases or spreadsheet programs.*
- *Database back-up and restore functions are integrated to reduce errors.*

System Requirements:

- *Available on **IBM-PC, SIRIUS, NCR, TEXAS, WANG-PC, DEC** and other 16 bit computers. Requires a minimum of 128K memory and 2 disk drives (on some micros a minimum of 192K memory is required).*
- *Supports floppy or hard disk drives.*
- *Supports all popular printers.*



So powerful you'll have a complete application within hours

- *Lay out your forms on the screen. Define data entry fields anywhere by answering simple questions. Revise the forms any time without losing data.*
- *Easy, fast and accurate way to fill-in the forms and enter, view or revise records.*
- *The reports or transactions requirements are defined in the English-like query language by answering simple questions. Select records any number of ways, combine up to 5 forms per report, perform calculations, get totals, sub-totals, or statistical summary. For complete transaction processing, delete, modify or enter records.*
- *Reports are automatically formatted in several ways, or specify your own format using the Report Editor.*
- *To format a report complete with text, data, and graphs; use the optional MASTERWORD word-processor or the GRAPHMASTER graphics facility.*
- *Display or print the report output, or take it to your spreadsheet, word processing, or graphics programs.*
- *Organise the access to your forms and reports by setting up your own menus.*
- *The underlying Relational Database Manager provides efficient storage and retrieval of records. It uses B-tree indices for efficient accessing of records, and cache memory to retain the most recently used disk sectors to reduce disk access by 50 percent.*

SOME OF THE DATAMASTER APPLICATIONS:

Inventory Control, Personnel Management, Job Accounting, Mailing List, Accounting, Order Processing, Market Analysis, Financial Portfolio, Medical Office Systems, Real Estate, Agriculture, Distribution Management, Social Sciences, Bibliography, Library Management, School Records.

ANOTHER **NEW** PRODUCT FROM

THE SAPPHIRE MASTER RANGE

SAPPHIRE SYSTEMS LTD. 1-3 PARK AVENUE ILFORD ESSEX IG1 4LU TELEPHONE: 01-554 0582

DATAMASTER is available **NOW** to let **YOU** organise your business the way you want it. So clip the coupon to see a demonstration of DATAMASTER on your own micro or at your local Sapphire dealer.

To: Sapphire Systems Ltd., 1-3 Park Avenue, Ilford, Essex IG1 4LU.
Telephone: 01-554 0582.

Please send me.....copies of the DATAMASTER DEMONSTRATION SYSTEM @ £5.50 inc. VAT & p.p. per copy for my: –

☐ IBM-PC ☐ Sirius ☐ NCR ☐ Texas ☐ Wang-PC ☐ DEC

Please debit my:

Access Card No:..... for £.....

Barclaycard No:..... for £.....

I understand that £5.00 will be refunded on the return of the demonstration system or on the subsequent purchase of the DATAMASTER full system.

☐ Please arrange for a demonstration of DATAMASTER.

☐ Please send me further details of DATAMASTER and the SAPPHIRE SYSTEMS MASTER RANGE of business software.

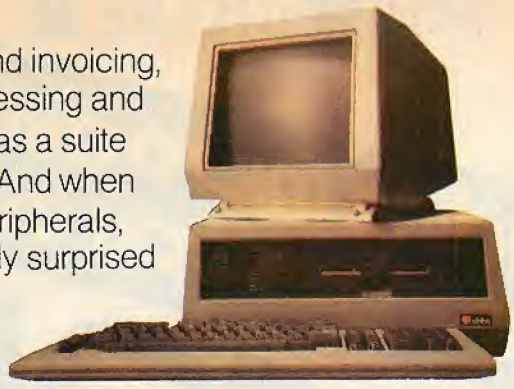
rom accounting, wages and invoicing, o stock control, word processing and lesign, your local dealer has a suite f software that fits the bill. And when comes to printers and peripherals, ve think you'll be pleasantly surprised t the range and quality f units we have available o complete your system.



Extensive local training

Now you have a business system that not only matches your equirements exactly, but also has the in-built flexibility to grow with your company. In order to get the very best from your system, DRG Dealers provide extensive local training programmes that leave nothing to chance.

Don't forget maintenance

Our nationwide on-the-spot service a maintenance contract taken out direct with DRG.

This saves you any worries about local availability and time wasting; we're never more than minutes away.

£600m of support

Unlike any others, the DRG Dealer chain (and more importantly their customers) benefit from the strength and stability of the £600m DRG parent company.

Like the computer, we're here to stay.

ASHTON·TATE ■ dBASE II

The world's leading micro database package can now give you even more.

QUICKCODE™

Gets the most out of dBASE II fast.

QUICKCODE – FOR PROFESSIONALS

With QUICKCODE professionals can concentrate on using their creativity for the interesting parts of the job and not get bogged down in repetitive detail.

QUICKCODE produces dBASE II command files to carry out many of the routine data handling tasks that come up again and again in every application. QUICKCODE does it automatically – you design the screen layout and QUICKCODE produces the code – an error-free foundation on which you can build your system. QUICKCODE gives you more valuable time.

To give their clients fast and accurate results professionals choose QUICKCODE.

QUICKCODE – FOR NEW USERS

Imagine – you've just bought the market leader – dBASE II. Probably one of the most powerful packages you'll ever buy for your micro. You know it is flexible and very comprehensive. You can't wait to get started. With QUICKCODE you can get started fast.

QUICKCODE creates a complete database from your simple screen layout. In addition QUICKCODE automatically generates 12 dBASE II programs to manage your data. Programs to Add data, Edit data and verify it. Programs to produce labels and even to link your database to WordStar. Automatically.

QUICKCODE gets the most out of dBASE II fast.

Transferring programs

SINCE THE Commodore 64 has 40 characters on a line, and uses the same character set as the Pet and the same Basic, there should be ample scope for using Pet programs directly on the Commodore with little or no modification. As long as the programs contain no Peek, Poke, Sys or Wait commands, they should be completely portable.

In reality few programs are that simple. The commonest Peeks and Pokes are to the screen; on the Commodore 64 screen memory starts at location 1024 whereas on the Pet it starts at 32768. Fortunately, the 64 is flexible enough to move things around so that the screen memory can be moved to start at 32768.

The sequence of commands in listing 1 sets up the necessary parameters to make the Commodore 64 look like a Pet. The first line moves the screen itself, the second tells the Basic interpreter what has happened and the last two simply clear out any rubbish that is left over.

Any Pet program can now be loaded and examined, although it is possible that when the program is listed the first line may be badly corrupted. This is a result of the way some Basic programs are saved, especially on older-model Pets. If this does occur, it is very simple to recover the situation by the sequence of Pokes in listing 2.

Once the program has been converted to your satisfaction, the necessary reconfiguration can be achieved by adding the three lines of listing 3 to the start of the program and saving it again. In the future, loading the program will not put it at the same place in the 64 as it was in the Pet, but this should not be a problem unless the program is extremely long.

Despite all this, straight Pokes to the screen will still not work. Whenever the 64 screen is cleared, the colour memory is reset to the same colour as the background, which means that any characters Poked on to the screen will not be seen.

One way of solving the problem is to Poke a colour into colour memory whenever a screen Poke occurs. This can most easily be done by simply adding 22528 to the screen Poke location and putting the correct colour code there. Another way is to fill the colour memory with a different colour every time the screen is cleared. A simple For-Next loop would do the trick, but would be unbearably slow.

A neater solution is provided in the subroutine of listing 4, which actually makes use of the fact that the colour memory is set to the background colour. The first line changes the background colour to the same colour as the current character printing colour, in location 646, first preserving the background colour.

The screen is then cleared, so setting the colour memory, and then the background colour is restored. By removing all Clear Screen characters in the program, and inserting Gosub 63400 just before each Print statement containing a Clear Screen character, the Poke problems on the screen will be solved. It is, of course, possible that there are other Peeks and Pokes in the program which are rather trickier to deal with, but they will have to wait until a later date.

Finally, there is a bug on the Commodore 64 which affects the Input command when the prompt continues over the end of a line. The Pet is quite happy with this, but the 64 will not read the input correctly, so some Input statements and their associated Prints may have to be changed to avoid printing beyond the end of a line.

I must thank Bob Merry of Stockport for providing many of the ideas for using Pet programs on the Commodore 64.

Cataloguing discs

There are many ways of getting at the file names on a disc, all of which involve opening special files and a lot of Get # commands. These methods certainly work, but they require careful counting of the characters received. The result is often a complicated and rather inelegant program.

Now L V Turner of Colchester has produced an extremely simple and rather elegant approach to the problem. It involves reading the directory and generating a sequential disc file containing all the directory information. His program relies on the Directory command in Basic 4, which normally prints the directory on to the screen, and the method is simple.

Listing 1 shows the program which, first of all, opens a suitable sequential file on the disc in line 200. There is no reason why this should not be an Append command so that a complete file of all disc directories is built up. Just before the Directory command is issued, the output which would normally

(continued from previous page)

go to the screen is redirected to the disc file with the CMD2 in line 220.

As the directory is read, it is no longer printed on the screen but is redirected to the disc file. Lines 230 and 240 do the necessary closing out routine when the directory is complete. Now the file exists as a series of individual sequential file entries, each separated by a Carriage Return. They can be read back again using the Input# command.

An example of how this could be done is also included in the program. Line 410 reads the directory heading, and then lines 430 to 460 read the rest of the directory and print it to the screen. Of course, there is no reason why line 450 should not be replaced with a routine to put the file information into an array or to extract any information required simply using the Mid$ command.

Those who have worked with computers for more than a few weeks will not be surprised to learn that there are problems with the technique. The file Catalog will be shown as though it has not been closed. This is to be expected, as the file was open while the directory was being read.

The disc drive handles directories rather differently to normal files, and there are problems when it comes to do the Blocks Free total at the end of the directory. In fact it will not make much sense, so it should not be used to work out how much space is left. The final problem is that, for some reason, trying to read the directory of only one of the drives does not work. This again is probably a quirk of the way that the disc operating system generates the directory listing.

A version for Basic 2 users is given in listing 2. The main problem is that Basic 2 has no facility for listing the directory directly on to the screen. You have to execute a few commands directly from the keyboard; they are given at the start of the listing. The principle is exactly the same, but the directory must first be loaded into the computer, and then listed to the disc drive.

With this technique, the problems of having files open while reading the directory no longer exist, and the directory loading can be for one or both drives and can follow the usual conventions of a selective directory listing. For instance, to read only the program files from drive 1, replace the Load command with:

```
LOAD "$1:* = P",8
```

The number of blocks free should be correct.

So, where is the problem? The last line to be listed will actually be the "Ready." message that would normally have been printed on the screen. However, as long as you know it is there it should not cause any difficulties.

The read-back operation is almost identical to the Basic 4 version, except that the file is opened in the Basic 2 way, as in line 400. There is no doubt that this is a case of "Why didn't I think of it before?"

Bombing Monster

Games are often a useful way of learning programming techniques, especially when they include the complexities of high-resolution graphics or user-defined characters. Thomas and Kim Gustafsson have written a fairly simple bombing game for the Vic-20, in which a craft flies across the screen and drops a bomb when a key is pressed. The object is to destroy as many of the round objects at the bottom of the screen as possible.

Each target object is actually a user-defined character containing a number which represents the score achieved when it is hit. Only four misses are allowed before the game stops and you are given the score.

The distinguishing feature of this game is that the bomb does not drop straight down. Instead, it continues travelling from left to right with an element of intertia, which makes the task of targeting that much more difficult.

The program is in several distinct sections. Initial setting up, including the setting of the Vic control registers, is done in lines 98 to 150, and the character definitions are set up is lines 160 to 290. Each character is set up individually, with the first being a space, all 0s, and the last a solid block, 1s. Lines 490 to 580 set up the screen itself. The game proper continues from line 600 onwards, the instructions being held in a subroutine at line 5000.

The techniques used show how straightforward it can be to set up a simple sequence of user-defined characters to make a simple game look just that bit more exciting.

Screen dump

ONE OF the first responses to my request last July for a text-editing program to complement Letter Writer came from Mr A Atkins of Coventry. Although not quite what I had in min, it is interesting in itself and demonstrates how to address the memory for the currently open screen. The program will work with either 40 or 80 character lines, and you can select the lines you wish to print.

Bytes 92 and 93 hold the address of the current screen's data area, calculated at line 60030. Line 60070 calculates the location of the first byte of the display buffer; the first byte of the screen data area contains an offset from which it can be worked out. The questions appear on the VF display of a model AD. If you have a model A delete line 60010 and remove all references to stream £3 for the prompts to be displayed on the video screen.

To use the program, open stream 0 with a suitable line width and number of lines. To print a letter, just type it in using the cursor-control keys to go to a new line. To print a portion of a program, or a display created by a program, load the program using Merge; the program must not use line numbers above 60000. Then run Screen Dump by typing Goto 60005.

Card index

This program by Stephen Hall of Horndean, Hampshire allows users with no programming experience to format their own index cards. You can search through them for any word or value, and print the results of the search on a Seikosha GP-250X printer, if available.

Amendments are easily made by pressing A when the card to be altered is shown on the screen. The cursor then appears and can be moved to the area to be altered by using the Right Cursor control. Any card shown can be printed by pressing P, and the 100 index cards can be saved on cassette by pressing S. Concise instructions are given on the screen.

Renumber

This useful routine to renumber the lines of your Basic programs has been sent in by Mr A R Armitstead of Blackpool. It will not alter your Gotos and Gosubs, so you will have to trace them yourself. Programs to be renumbered should not contain any lines numbered 60000 or greater.

To use the routine merge it into the program to be renumbered, set the starting line number and step size at lines 60140 and 60150, then type Goto 60000. The routine does not renumber itself, so it can be used again.

The Newbrain stores program lines in an unusual way, using three distinct areas of memory to hold all the information needed to execute a statement. The line-number

(continued on next page)

(continued from previous page)

table, LNT, contains an entry for each Basic statement, consisting of:

- The statement line number as two bytes, low then high.
- A pointer to the compressed Basic statements as two bytes; this is the second area, the source code area.
- A pointer to the compiled version as two bytes. If the statement has not been compiled, it contains 0. This is the object code area.

The LNT is pointed to by locations IY + 30 and IY + 31, where the address of IY is stored at locations 22 and 23.

Lines 60260 to 60360 contain a routine to display the first 18 entries of the line-number table. They are not part of the renumber program and may be deleted if not required.

Renumber.

Brain-Man

A version of the popular Pacman game is provided by Rory Stafford. The maze has been simplified, and only one monster is used, but the game is very fast.

The program uses character set 3. Line 15 sets it with the statement

PUT 31,23,72

The Call at line 180 resets the system clock to zero if a power pill is eaten, and line 240 reads the value of the clock so the monster runs away during the following five seconds. This line could be changed to make the game easier to play. Lines 610 to 695 print the maze. The character listed as S should be typed as an inverse space, ASCII 128, by pressing Graphics-=.

trendtext

Bringing word processing out of the Stone Age

Trendtext is a complete word processing environment designed for today's micro-computers. Hundreds of WP users have told us Trendtext is easy to learn and easy to use. And now we've included superb features missing from other WP packages.

You get extensive document creation, editing and printing facilities, mail merge, word count, table of contents and index generation as standard features, not expensive extras.

Trendtext has been specially tailored to run on most major business microcomputers and is stocked by dealers all over the country. Microtrend has companies in Britain, Germany and Holland, supplying Trendtext in nine European languages. For more details write or ring us on 0423 711878

Meet the fa

Minstrel + TurboDOS

the marriage of reliability and versatility

Minstrel

The Minstrel is an exciting new British micro-computer and offers Winchester-based systems at fantastically low prices. The range extends from single-floppy single-user CP/M systems right up to a 68000-based model and includes an 8086-based range.

The Minstrel is compatible with the North Star Horizon and offers a superior alternative at a much better price.

There is a network of Minstrel dealers in the UK and Europe. Contact us for the name of your local dealer. Dealer enquiries invited.

S100 bus

The amazing versatility of the Minstrel is due to the bus used: the S100 bus. This bus system is not only future-proof—the future is created on the S100 bus. Every major micro-computer development appears first on the S100 bus. Now over 150 manufacturers make S100 products and their combined range approaches 1000 boards.

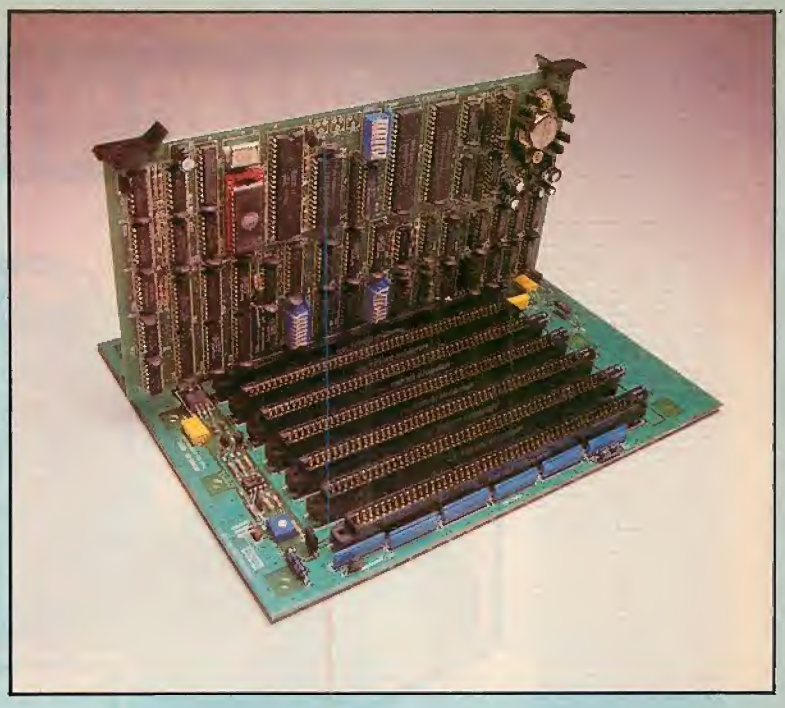
mily

One machine – eight computers

Yes! Inside the Minstrel micro-computer illustrated there are actually 8 Z80A single-board computers. One is dedicated to each user of the system resulting in astonishing performance. A ninth processor controls central disk storage and printers.

TurboDOS provides sophisticated spooling for multiple printers, supports 1000Mb disk drives and 128Mb files, and employs powerful disk buffering techniques.



TurboDOS®

CP/M COMPATIBLE MULTI-USER OPERATING SYSTEM

TurboDOS is a popular high-performance multi-processor operating system. Each user has their own slave processor board (illustrated above). TurboDOS systems have been shown to out-perform mini-computers in the DEC PDP11/34 class at a fraction of the hardware cost.

TurboDOS is compatible with CP/M, the industry standard operating system, which means you have access to a vast range of off-the-shelf software.

The next development to TurboDOS on the Minstrel allows you to connect systems together via a Local Area Network.

ASTONISHING PRICES!

Minstrel with two 400Kb floppy drives £1790.
With 1 400Kb drive and 5Mb Winchester £2615.

A sample 2-user TurboDOS system including:

Minstrel
1 800Kb floppy
1 5Mb Winchester
2 slave processor cards
2 KDS7362 VDU's (illus)
1 Epson printer

ONLY
£5420

A sample 5-user TurboDOS system including:

Minstrel
1 800Kb floppy
1 20Mb Winchester
5 slave processor cards
5 KDS7362 VDUs (illus)
1 Epson printer
1 OKI 84 printer

ONLY
£9850

TurboDOS is a registered Trade Mark of Software 2000, Inc.

BRAND NEW FROM THE USA

FOR THE MICRO ON THE MOVE

Computer Carrying Cases provide the protection that you need. Padded with high density foam to cushion your computer during transit. Finished in tough, steel grey Cordura nylon these cases are available for most micros including:–

IBM P.C., Apple, Atari, Commodore, Sinclair and Osborne.

Price for case specifically designed for Atari/Commodore Vic 20 or Vic 64 is £28-95 inc VAT & carriage.
Contact us **NOW** for full information and details of this exciting new product.

Short and Sharp

For too long the Sharps seem to have existed in the shadow of other machines. First it was the Pets, Apples and Tandys; now it is the BBC and Sinclair machines. But perhaps the blame lies with us, the owners and users. Rather than pester the computer press with queries, articles, hints, tips and programs we have resigned ourselves to a second-rate existence in which we tell each other what wonderful micros the Sharps are, and how foolish the rest of the world is not to realise what it is missing. So now is your chance — let the contributions roll.

I have just one plea to make, and that is for brevity. Each Open File section will be at most two magazine pages long. It is very difficult to accept any contribution of more than three pages of double-spaced A4 typescript or 120 lines of listing. Material for Open File should be short and snappy. For tips and hints listings can be open and easy to follow, but for games and other programs where the result is more important than the ideas and techniques illustrated they should be as densely packed as possible.

The null-input problem

It is perhaps best to employ input routines using the Get command, and best of all to do it in machine code. There is still a place for the humble Input, the trouble is that it is difficult to cope with a null input. If some careless and heavy-fingered user presses Return without entering anything else first, Basic kindly starts a new line with a question mark and waits for a fresh input, which makes an awful mess of a neatly formatted screen.

What is required is something the Input routine will pick up even if nothing but Return has been pressed. Moreover, if that something is unusual and distinctive, then the rest of the program can check for its existence and take whatever remedial action may be necessary.

How is this to be done? The first idea that comes to mind is to Print a special character immediately after the input prompt, then cursor left, and then to use Input "" to suppress the question mark and leave the cursor sitting on the character. For example:

```
PRINT "PROMPT:-*(cursor-left)";
  :INPUT"";A$
```

but unfortunately this does not work; the Input routine is not fooled.

IN MOST MICROS, including the MZ-80 series, each line is stored in memory in a four-part format. It begins wih a link identifying the next line's start, and is followed by the line number, the content of the line itself and the end-of-line marker, which is 0Dhex for the Sharps.

For the Sharp PC-1500 hand-held computer the format is slightly different. Each line starts with the line number, which occupies two bytes, followed by a single-bye relative link giving the length of the line's content, including the end-of-line marker. Then there is the line content and the end-of-line marker itself.

During editing the relative link tells the editor how many of the next few bytes belong to the current line, and should be prepared for display. During operation it tells the interpreter where to jump to find the next line when executing a Goto or Gosub if the current line has the wrong label or line number.

What is of interest about this is that the editor and interpreter work in rather different ways when actually reading a line. The interpreter scans and executes each line up to the end-of-line marker, Gotos, and so on excepted, and then automatically carries on, assuming the next byte is the start of the next line.

The editor, however, displays the line up to the end-of-line marker, beyond which the cursor cannot be moved, and uses the link to find the start of the subsequent line. One or more lines can be hidden from the editor, and thus from anyone Listing the program, even though it will run quite happily. This can be arranged by the simple expedient of Poking into memory a value for the previous line's link that points not to the line's own end-of-line marker but to that of the line to be hidden.

The listing shows a simple look-at-memory program before it has been nobbled in this way. Assuming no other program is in memory, line 10 starts at locations 16581/2 with the high/low byte of the line number, and 16583 holds 31, the number of bytes up to and including the end-of-line marker, which is at 16614. Line 15 begins at 16615, and 16617 holds 15, the number of bytes up to its end-of-line marker at 16632. The total number of bytes from the line 10 link at 16583 up to the line 15 end-of-line marker at 16632 is 49. If 49 is Poked into 15583, line 15 apparently disappears. If some unscruplous person deletes line 10, then line 15 actually dissappears and the program does not run properly any more.

"Look-at-memory" program.

```
10:REM  MYPROG <C
   > FRED BLOGGS
   1983
15:MS=16851:WAIT
   :TEXT
20:FOR A=0TO 1000
   :ML=MS+A:P=
   PEEK ML
30:PRINT P;"  ";M
   L;"  ";CHR$ P;
   "  ";:CURSOR 0
40:NEXT A
50:PRINT "THE END
   ":END
```

The next idea involves Printing a new line of cursor-rights over the input prompt, ending up on the character:

```
PRINT "PROMPT:-*":PRINT"(cursor-up;
  nine cursor-rights)";: INPUT "";A$
```

which does work, but is rather laborious in a general input routine designed to handle any input anywhere on the screen. And maybe the user will not want confusing characters at the start of each input field.

But these two objections can be dealt with. First, the X,Y co-ordinates of the position on the screen of the beginning of the input field can be found by Peeking 4465 and 4466 just before the Input statement. The top line and the left-most column are zero. These co-ordinates enable the special character to be Printed — or, preferabley, Poked — into that position. Rather oddly the character with the display code 240, which appears to be a space, is not a space at all so far as the input routine is concerned. Instead, it is ASCII character 197 — the left-most line character with the display code 113. So, if it is Poked into place at the start of the input field, and not overwritten by any key press, it is picked up as the input. The form is:

```
PRINT "PROMPT:- ";:POKE
  53248+PEEK(4465)+40*PEEK(4466),
  240:INPUT "";A$
```

where 53248 is the start of the screen memory. This provides both a user-invisible first line of defence against the careless key presser and the means, via a check for the input having the ASCII Code 197, to initiate remedial action. Do not forget to Poke 10167,1 to remove the Peek protect.

AN ALMOST unlimited number of points can be plotted as a simple line graph using this program. The data can be filed on either tape or disc or in Data program lines, and the number of items of data can be almost unlimited. When the program is run it first draws the X and Y axes with appropriate markers followed by the first 128 items of data. When you press the space bar, the next 128 items of data are drawn and the previous line is erased. Successive sections of the graph will thus be drawn until all the items of data are exhausted. The end of the data in the program is indicated by a zero.

Lines 4 to 8 contain a specimen set of data and have no other significance. Your own data is entered here or elsewhere if you are using Data program lines. The data is actually read in line 270 as a variable D(X). If necessary you could insert a file opening and reading routine.

Code Breaker

Keith Blount of Northampton has sent in a program which he calls Code Breaker. It is a logical puzzle very much after the style of the well known Mastermind game. Mr Blount tells us very little about the rules as instructions are included in the program. Part of the puzzle is to decide how the rules work: don't be put off, just use your head to work it out.

OKI
MICROLINE

Microline 82A and 83A

High quality and performance as well as an attractive price are key features of these printers. Built on a moulded aluminium plate and driven by 2 motors.

These printers can work almost without limitation, as the printhead's design allows for over 200 million characters to be printed. The short line logic seeking printing speed is rated at 120 cps. The carriage width allows for the printing of 80 characteres (model 82A) and 136 characters (model 83A).

Character sets for several languages and graphics printing are standard features of these printers as well as the processing of various paper types.

The interfaces provided allow for parallel or serial data transfer – buffered or unbuffered – from most popular desktop computers and widely-used PCs.

MICROLINE – more than 150. 000 printers in Europe in use.

Shoot-out

A SMALL joystick-controlled aiming game with dodging targets approaching over a scrolled mountain terrain has been submitted by Mr D Turnbull of Vaud in Switzerland. He displays his sense of humour not least in placing the movement and firing controls on different joysticks; some of its other aspects become apparent later in the game. There is a curious symbolism in denoting the good guy by a > character and the victims as <, which rather indicates from the start who is likely to get the better of the scrap.

On line 8 a literal \ is coded. It is entered by typing:

8 DS$ = "Ctrl-x

at which point the line is terminated by pressing Return. To get the final quote, Esc-I, copy to the end of line and add the last character. A simpler alternative is to code:

8 DS$ = CHR$(92)

instead. I have been puzzling for far longer than is reasonable about what causes the first option to work at all.

The sound routine in lines 4 and 5 is a standard Poke pitch, Poke duration, Call format, the addresses being held as Pi, Du and No.

```
1  GOSUB 86
2  TEXT : SPEED= 255

Low-resolution screen formatter

Basic programs frequently carry screen-loads of instructions about with them as embedded code, using up memory while the program is resident and requiring effort to code up in the first place. A screen formatter from John Cayley of Durham lets you prepare and amend binary files containing the text in a format suitable for display when brought into memory through a corresponding assembler module. The assembler is prepared through a small Basic program which Pokes the routine into memory and BSaves it. Text is saved in a condensed rather than display format, which saves some disc space.

When running the formatting program, Encode.Obj must be on disc. When running the user program, Decode.Obj must be in memory; it is put there by entering:

```
PRINT CHR$ (4) ; "BLOAD DECODE.OBJ"
```

When you want to load the screen itself, put its name into a string variable and Gosub to a routine with the following lines:

```
  PUT = PEEK (110) + 1
  POKE 8 , 0 : POKE 9 , PUT
  PUT = PUT * 256
PRINT CHR$ (4) ; "BLOAD" SCREEN$
",A" PUT
  CALL 768
```

Screen formatter.

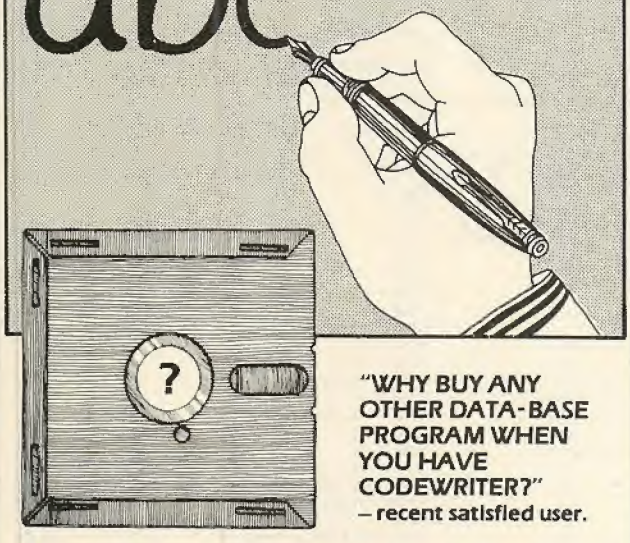
CodeWriter

makes data-base and related programming as simple as abc



"WHY BUY ANY OTHER DATA-BASE PROGRAM WHEN YOU HAVE CODEWRITER?" – recent satisfied user.

Forget about the expense of hiring a professional programmer or the restrictions of 'off-the-shelf' programs. Become your own program designer producing microsoftware to suit your specific requirements. Codewriter enables you to do this, you type commands in your own everyday language, just as you would write them on paper . . . it's as simple as ABC!

When you've completed your design, Codewriter will write the program code and store it on your own disk whilst you sit back and watch. At anytime, you can of course modify the programs you've designed.

Your programs may include data bases printed reports, calculations and comparisons between fields of data, development of menus, forms, letters, memos, cheques, invoices, statements, mailing labels . . . the possibilities for design are endless. Codewriter operates with most popular micros and will be demonstrated fully at your local dealer.

For details on Codewriter, complete and return the coupon to;

Disc saver

A COMMODORE LISTING for a disc file restore on page 163 of the September issue inspired H M Hoffman to devise a way of restoring deleted Atari disc files. Mr Hoffman says if a file is deleted from DOS 2 or Basic, the first byte in the directory entry is set to $80 or 128 decimal. Whenever the directory is searched, any entry associated with this flag value is ignored. However, after booting DOS, it is possible to issue a command from Basic so that files will no longer be checked for a deleted status. The command is

POKE 3926,234:POKE 3927,234

Listing the disc directory will then reveal the deleted files so that they can be loaded and run. Undeleted files should be loaded and then saved with a different file name so that they can be read normally under DOS. Obviously, if you write to a disc after deleting a file, the deleted file may be overwritten and thus be unrecoverable. The command Poke 3926,48 : Poke 3927,27 restores DOS to normal.

Painter

At last here's an Atari game. Painter, written by Chris Simon of Clwyd, North Wales, requires 16K and a joystick. Use the joystick to move the painter to cover all the lines, while avoiding the chaser. Pressing the Fire button creates a gap the chaser cannot jump.

Three complete mazes are included, but you can easily add your own. For an interesting variation, add the line

190 GOTO 100

so that whenever the painter stops moving the chaser will start, and vice versa. It speeds the game up, and is not as easy at it sounds. Another enhancement would be to add a routine to fill boxes with colour when they are completed.

Even if you do not type in the whole program it is worth experimenting with the sound subroutine, which is done with Pokes instead of sound statements.

MicroSight

Use your BBC Model B as an image analyser with :-

MicroSight I

Available on BBC, Apple, Commodore, Research Machine, Sirius, etc, Includes Camera cables, interface, software and documentation.

£495.00 + VAT

MicroScale.

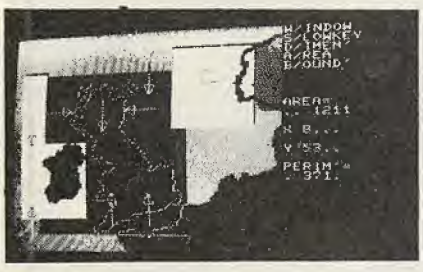

Image processing software to calculate area and perimeter of objects within a specified window also to dimension features. Disk and printer dumps of binary and grey scale data.

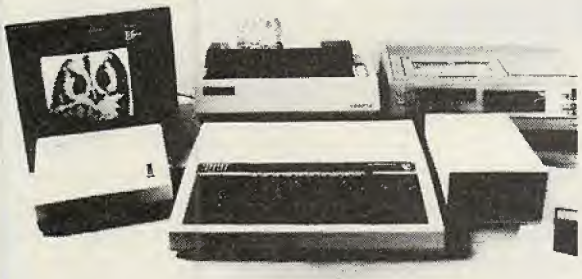
£295.00 + VAT

MicroEye Vision Interface.



256 x 256 pixel resolution with 255 grey levels per pixel comes complete with software and documentation. Can be used for video tape digitising Satallite picture analysis etc. Available for BBC, Apple, Commodore, Research Machine, Sirius etc.

£295.00 + VAT

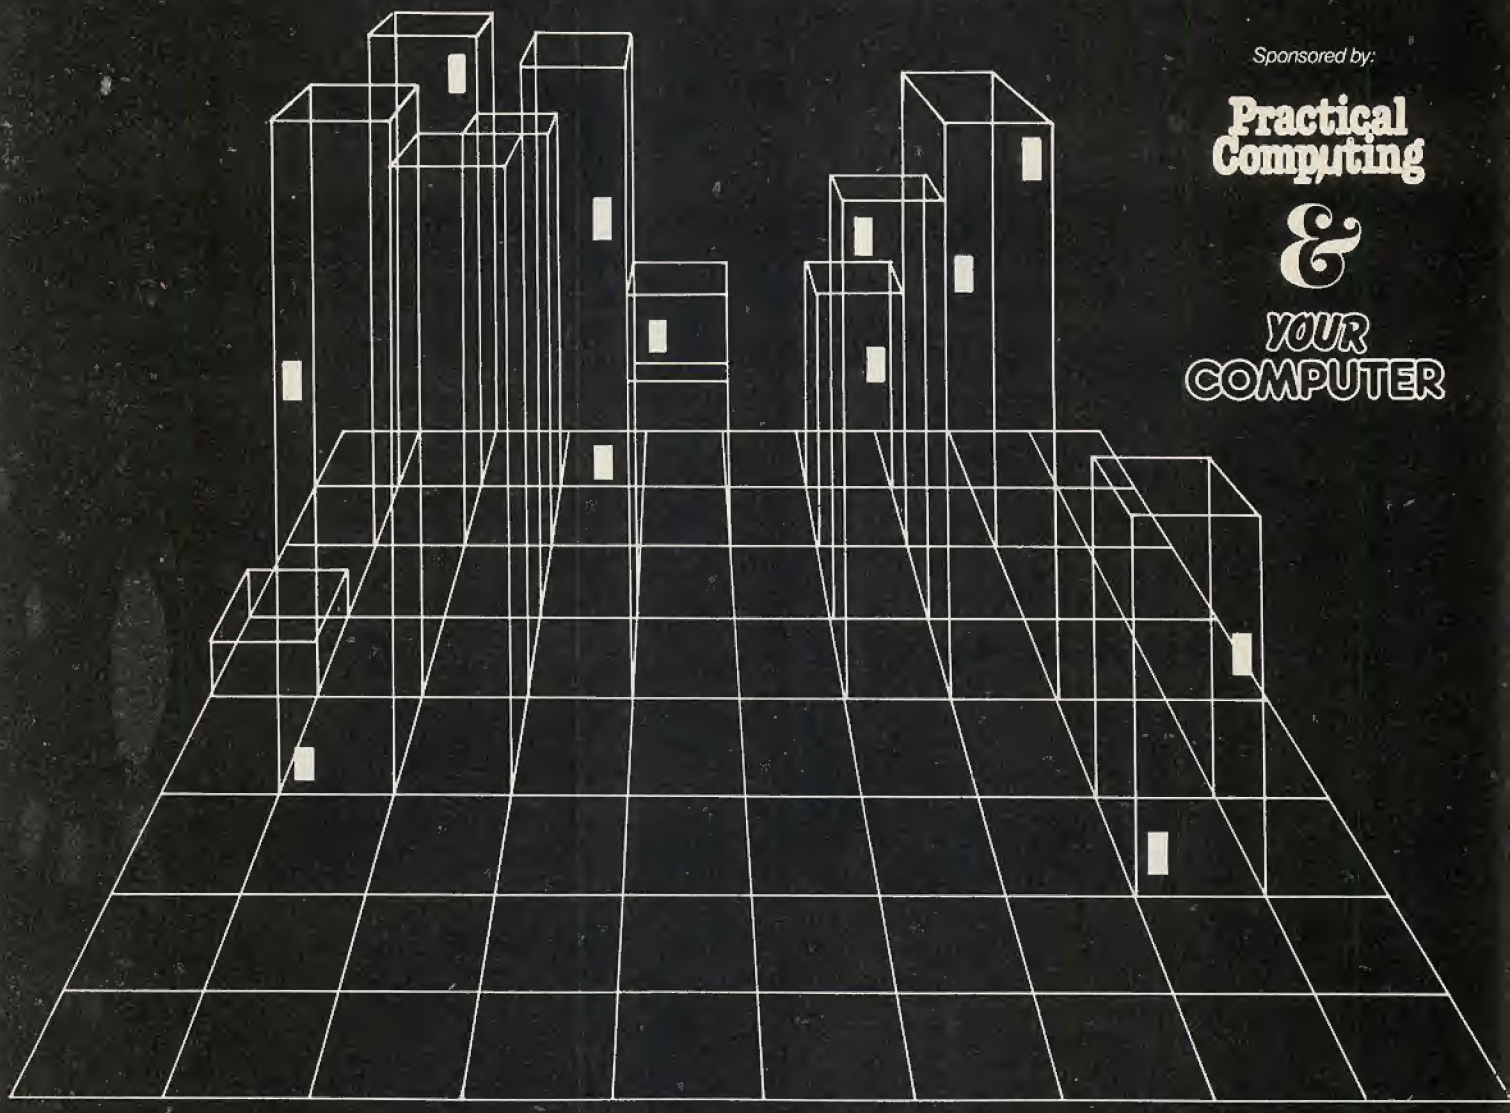
1984 On Course For Record Computer Sales



Sponsored by:

Practical Computing

&

YOUR COMPUTER

There can be few – if any – comparable exhibitions capable of generating such intense public interest as The Computer Fair series.

As expected, the 1983 Computer Fair, held at Earls Court, has consolidated its position as the major showcase for home and small business computers, to the extent that it became necessary for the original exhibition area to be doubled to a record 2,300 square metres. And all the signs are emerging to support our belief that 1984 will see further growth in an exhibition which provides an unrivalled opportunity for promoting personal computer systems of all kinds.

Sponsored by 'Practical Computing' and 'Your Computer' and organised by Reed Exhibitions, the 1984 London Computer Fair will again be backed by a massive publicity campaign using radio, television and press media. Advance stand reservations are understandably already well up on 1983. If you want to ensure that you do not miss out on a preferential site, you really must fill in the coupon below NOW, and return to the

Exhibitions Manager, The Computer Fair,

Scrubber

A PAIR of programs from Bill Leigh of Varese, Italy make up a useful program-development utility for 16K and 48K Spectrums. Scrubber itself consists of two lines only; the Rem statement in the second line reserves space for the machine-code program of which the hex listing is found in the consecutive Data statements of the second program, Makescrub.

Makescrub is more or less a hex loader written to construct Scrubber. The Rems in lines with numbers ending in 9 are essentially cosmetic and may be omitted. Makescrub loads hex-coded bytes in the Data statements of lines 109 to 170. It also contains some elementary partial trapping of keying errors in lines 500 to 550. It executes Scrubber after hex loading, thereby simply generating Scrubber itself. If the two lines that compose the Scrubber are allocated consecutive line numbers anywhere in a Basic program, then when the program control reaches these lines all previous lines of the program (but nothing in the variables area) are eliminated, while the variable area remains intact.

Scrubber can be used to save space by eliminating part of a program once it has done its work — setting up a screen, for example, the space saved can be used for data input to, or generated by, the rest of the program.

It can also be used when you have a large dummy main program that has been used to set up and test a subroutine. These all have to be eliminated before the subroutine is available for use. Scrubber can also be used to Scrub hex loaders, of course.

The programs also demonstrate how, by Peeking the system variable NxtLin, you can get away from the restrictions inherent in the normal practice of putting machine code into Rem statements at the top of the program listing. Apart from the inflexibility of the normal approach, a listing of such a program cannot conveniently include header lines such as I have given Makescrub.

I find myself making good use of Scrubber, merging it into longer programs, moving it about by changing the line numbers, and then Scrubbing unwanted program lines.

Scrubber.

Vocabulary

If you need help memorising foreign-language vocabularies Michael Coombes has come up with just the program for you. It is suitable for both 16K and 48K Spectrums.

When the program is run, an introduction page is first displayed, followed by a menu. Your first task is to enter the vocabulary, and you can then select the Test option. The program will ask for 10 translations, either English to foreign or vice versa. The program then tells you your score and returns you to the menu. There is also a Save option so that the program can be stored and retrieved for a later test.

Assembler for the IBM PC

Paul Myerscough looks at the guides available for those preparing to delve below the surface of the PC's operating software.

AT THE HEART of the IBM PC is an Intel 8088 microprocessor. It is this chip that provides the instruction set and hence lays the ground rules for assembler programming. The 8086/88 family of processors has been available for five years now, and several books have been published that describe their programming and hardware features. Two new books are specific to the IBM PC and more are on the way, no doubt inspired by the news that the PC started outselling Apple in the U.S. last summer.

The iAPX-88 Book is produced by Intel, the company that designed the 8088. Not surprisingly, it provides an excellent and readable description of the chip architecture and instruction set. This book has been available for some time and is presented as a publication designed to sell the 8088 as well as inform potential users. The initials iAPX stand for Intel Advanced Processor System, and the iAPX-88 is a real or hypothetical computer based on the Intel 8088 CPU.

In their introduction the authors outline the architecture of the 8088 and describe what makes it superior to eight-bit microprocessors. This clear and concise discussion is comprehensible to anyone with a little basic knowledge on the subject. For those without it there is a supplement towards the back entitled "What is a Microcomputer?".

Intel assembler

For the programmer, the chapter "Architecture and Instructions" describes the concepts of segmented memory, the register structure, addressing modes, and the 8088 instructions grouped by function. A further 24 pages are devoted to assembly-language programming. Although the information is applicable to all 8088 assemblers, specific reference is made to ASM-86 which is Intel's own assembler. The text in this section is largely reproduced from *The 8086 Primer* by Stephen Morse, published by Hayden Book Co.

A short program is given by way of introduction to many of the concepts and terms employed in 8088 programming. The style is at once authoritative and concise, and the authors define their terms carefully and analytically as they are introduced. An assembler statement is built from different kinds of tokens, a token being an identifier, a reserved word, a constant, an operator, and so on.

Each category of token is discussed before the authors deal with statements, which they divide into instructions and directives. Instructions have their equivalent 8088 function; directives control the way the assembler generates the 8088 program from the instructions.

The directives described correspond with a subset of the psuedo-ops available with the IBM Macro Assembler and allow the definition of symbols, data storage, segments and procedures. The discussion that follows is clear but very condensed, covering general and 8088-specific programming techniques in a few pages with four short example programs to provide an idea of how real routines might look.

Some 110 pages, over one-third of the book, are devoted to an alphabetic table of instructions with one or two pages per instruction. Here you will find a description, details of the operation in pseudo-code format, the flags affected, the binary encoding, the required operands, clock times, instruction length and a coding example. This information is complete but lacks the illuminating explanations provided by Rector and Alexy in their book.

Osborne/McGraw-Hill books seem to be becoming the standard texts for assembler programming on microcomputers. *The 8086 Book* by Russell Rector and George Alexy was published in 1980 and is on the shelves once more after being unavailable for some months. Whereas Intel's book provides a readable and concise introduction to the 8088 microprocessor and 8088 programming, this one is much more of a reference work. The scope here is slightly more comprehensive.

Stock text

It is always a little strange when such specialised books should take the time to answer the question "What is programming?" One suspects that this publisher's word-processing software automatically pulls in the standard paragraphs on these subjects, which are admittedly concise and well presented. After this short general introduction two programming problems are presented and the reader is walked through the design process.

By page 20 the 8086 is introduced; from a programming point of view the 8086 and 8088 are identical, the only noticeable difference being run times. The description begins with the registers and the flags, and reference is made to the equivalent 8080 implementation. A discussion of the 8086 address modes follows. About 150 pages are used to describe the instruction set.

The concepts surrounding Intel's Multibus system are introduced, and some

(continued on next page)

(continued from previous page)
notes are provided on multi-processor configurations. The book ends with a set of appendices. They give a table summarising all the 8086 instruction in alphabetic mnemonic sequence and in object code numeric sequence; electrical and timing data sheets for the 8086/88 and related series of clock and bus controller; and notes on the differences between the 8086 and the 8088. These hardware differences effect some of the pin signals and the bus timing for the data/address cycles.

The two remaining books, as their titles indicate, are IBM PC oriented and give themselves a wider brief. They refer not only to the 8088 and its programming, but also to the PC-DOS operating system, the ROM BIOS and some of the additional hardware that is found in the PC. Both refer specifically to the IBM Macro Assembler, though it cannot function very differently from any other assembler for the 8088 CPU.

New breed

Scanlon's *IBM PC Assembler Language* is one of the new breed. A floppy disc prepared for use in conjuction with the book contains the example programs referred to in the text. It cannot be denied that this is a good idea. However, in this instance the publisher seems to be motivated by dollars: the programs cannot be described as useful outside of the context of this already expensive book, yet you have to pay an extra $34 for the diskette. By adding its real cost of two or three dollars on to the book and packaging them together successful sales would be assured.

The approach taken by Scanlon is that of a cataloguer. He brings together fairly comprehensively relevant information from all the IBM PC manuals, lists it, tabulates it, describes it, and provides some useful if unexciting example programs. By contrast, David Willen and Jeffrey Krantz in their *8088 Assembly Language Programming: the IBM PC* provide a clearer and more readable discussion of much the same subject matter, with original programming examples and excellent diagrams. They also manage to cover more topics more thoroughly in fewer pages. While Willen and Krantz have a style that is easy and authoritative, Scanlon's is more uneven and in places awkwardly verbose.

Both books launch into binary arithmetic and numbering systems and in a few pages seek to embrace bytes, nybbles, twos-complement form, and some discussion of the 8088 architecture. Such a short and general introduction is difficult to organise in a few pages and Scanlon is less successful here.

Under the label of "8088 Architecture" Willen and Krantz provide a well organised summary of the internal functions of the CPU and its instruction set by functional group, again with good explanatory diagrams. Then they quickly add all that is necessary to create a simple program: describing how it sits in memory, how it relates to DOS, and the BIOS. Some specifics about the IBM Macro Assembler are supplied, particularly the essential pseudo-op instructions to the assembler for reserving storage and defining procedures and segments. They take about 60 pages to describe this material.

Scanlon requires 120 pages to cover less ground — he does not even mention DOS and BIOS. Some of the more esoteric pseudo-ops provided by the IBM Macro Assembler are rather difficult to understand from the manual and here Scanlon's detailed explanation provides a welcome insight. However, even he is stumped when it comes to Record and Struc.

After these introductory chapters the two books diverge on to different paths. Scanlon takes a couple of chapters to cover higher-precision mathematics and data structure operations. Though the material he provides is useful for orienting the inexperienced programmer, it can be found in virtually any text on the subject. He approaches the keyboard, video display, cassette and the like from the point of view of a program looking outwards. The interrupts are catalogued and described, and a few simple programming examples are given.

Willen and Krantz follow their introduction to the CPU and the Macro Assembler with a thorough and interesting breakdown of the IBM PC hardware and its control. Starting with the system board they provide descriptions of the 8259 interrupt controller, the 8253 timer, and the 8255 programmable peripheral interface, which are all configured in the PC as I/O devices. They go on to discuss the other devices that are not on the system board. The chapter referring to the display and printer adaptors describes their operation at length and provides programs for both monochrome and colour/graphics use.

A typical application where Basic programming is often just not fast or versatile enough is that involving communications. For this reason, although it is an optional extra, the RS-232-C serial communication adaptor is of particular interest to the assembler programmer. The authors provide a good chapter on this device, describing asynchronous protocol, hos a Uart functions, and how it interfaces through an RS-232 interface to a modem. Programming of the Intel 8250 used by the IBM PC for controlling asychronous communication is described, and a simple terminal-emulation program is provided as an example.

Unlike Scanlon, Willen and Krantz do not shy away from disc I/O. Their chapter on the subject starts at basics with the anatomy of a diskette and takes you through file access using DOS to access at the track/sector level using BIOS routines.

The books discussed so far fall into one or more of the categories 8088 reference work, assembler programming text and IBM PC assembler-level guide. *Programming the 8086/8088* by James W Coffron falls between all three stools. He covers the 8086/88 in sufficient depth to provide a good introduction but the book is not comprehensive enough to be considered as a reference work.

On assembler programming Coffron discusses some important topics but others are omitted, and his program examples could be more frequent and more illuminating. A 20-page chapter on the IBM PC is dropped in almost as an afterthought and deals with only a few of the machine's features.

Numbers

Following the mould of the two PC-oriented books, Coffron starts by introducing number representation, binary arithmetic and associated processor-flag usage, and follows up with a summary review of the CPU archiecture and a detailed discussion of the 8086/88 address modes and their encoding.

Next comes a substantial chapter of 105 pages cataloguing the 8088 instruction-set mnemonics. Unlike Rector and Alexy, Coffron does not choose to expand on the information provided by Intel and leaves out some of the details available.

Programming techniques are introduced with some very basic arithmetic and a discussion of subroutines. This is followed by a useful review of external and internal CPU interrupts and a chapter on I/O ports and instructions In and Out. His program examples here are short and curious — to generate a delay, and to scan a four-by-four keyboard. Although the 8255 PIO and the 8253 timer chips are mentioned he does not convey their functions and uses as clearly as Willen and Krantz do.

The iAPX 88 Book, by the Intel Corporation. Published by Reston Publishing Company, Inc., 315 pages, £11

The 8086 Book by Russell Rector and George Alexy. Published by Osborne/McGraw-Hill, 595 pages, £13.95

* BETTER VALUE MAIL ORDER SUPPLIES FOR YOUR MICRO *

TDK DISKS

High grade flexible disks from one of the world's most famous suppliers. 5¼" and 8" disks, in boxes of 10.

5.25" DISKETTES

M1D–S	S/S, D/D, 48 TPI	£24.30
M2D–S	D/S, D/D, 48 TPI	£34.80
M2DX–S	D/S, D/D, 96 TPI	£45.50

48 TPI suitable for 35 or 40 track operation.
96 TPI suitable for 77 or 80 track operation.

8" DISKETTES

F1–S128	S/S, S/D	£27.60
F1–H32	S/S, S/D	£27.60
F2D–S1024	D/S, D/D	£40.10

DATALIFE DISKS

From Verbatim, the world's leading diskette manufacturer. Full 5 year warranty. All minidisks are certified for double density recording, and are fitted with hub ring reinforcement as standard.

Prices per box of 10 disks.

5.25" DISKETTES

MD525	S/S, D/D, 48 TPI	£18.25
MD550	D/S, D/D, 48 TPI	£27.15
MD577	S/S, D/D, 96 TPI	£25.55
MD557	D/S, D/D, 96 TPI	£34.20

48 TPI suitable for 35 or 40 track operation.
96 TPI suitable for 77 or 80 track operation.
10 and 16 hard sectored versions available at same prices.

8" DISKETTES

FD34–9000	S/S, S/D	£26.10
FD34–8000	S/S, D/D	£26.60
DD34–4001	D/S, D/D	£30.95

32 hard sectored versions available at same prices.

XIDEX DISKS

The new premier quality standard, against which all other manufacturers will have to be judged. All products certified for double density recording. Now with a **lifetime** warranty. Unreservedly recommended.

Prices per box of 10 disks.

5.25" DISKETTES

5012–1000	S/S, D/D, 48 TPI	£19.55
5022–1000	D/S, D/D, 48 TPI	£27.55
5012–2000	S/S, D/D, 96 TPI	£27.75
5022–2000	D/S, D/D, 96 TPI	£35.80

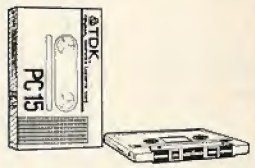
48 TPI suitable for 35 or 40 track operation.
96 TPI suitable for 77 or 80 track operation.
10 and 16 hard sectored versions available at same prices.

8" DISKETTES

8012–1000	S/S, D/D	£26.40
8022–1000	D/S, D/D	£31.90

32 hard sectored versions available at same prices.

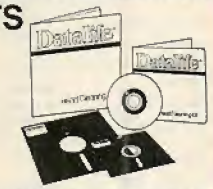
TDK CASSETTES



You know the name and the quality's the same. 15-minute computer grade cassettes for optimum performance in all standard microcomputer cassette drives. In boxes of 10.

TDK PC15	£5.90

DISK DRIVE HEAD CLEANING KITS

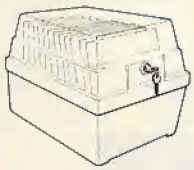


Helps to protect your valuable data, and minimise expensive downtime and repair costs. Consists of a flexible jacket, which receives a pre-saturated cleaning disk. Each disk is sealed within a foil sachet to ensure that it contains the right quantity of cleaning fluid when used. After use the disk is disposed of, and the jacket is kept for future use.

Suitable for single or dual head drives. Please specify 8" or 5.25" disks.

STARTER KIT (contains jacket and two cleaning disks)	£7.70
REPLACEMENT CLEANING KITS (pack of 10)	£14.80

DISKETTE STORAGE BOXES



Protect your diskettes and valuable data from external contamination. Lockable, portable and secure. Two part box made from anti-static ABS plastic. Price includes dividers and index labels. Capacity 80 disks.

A5 Storage box (for 8" disks)	£32.00
A6 Storage box (for 5.25" disks)	£22.00

CTI – CP80 PRINTER

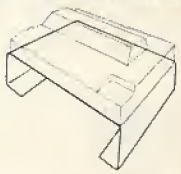
Features:—

Friction and tractor feed as standard
80 c.p.s.
Bi-directional logic seeking.
13 x 9 dot matrix giving true descenders.
Sub and superscripts.
Italic printing and auto underlining.
Condensed, emphasised, expanded and double strike printing (can be mixed in a line).
Parallel interface fitted as standard.
12 month warranty.

Print sample available on request.

CP–80 PRINTER	£249.00
Optional RS-232 interface	£40.00
Special VIC20/VIC 64 interface	£46.00

PRINTER STAND



Suitable for use with dot matrix printers. Lifts printer sufficiently to enable continuous stationery to self-stack. Painted steel unit.
Dimensions: 39cm wide
x 28cm deep
x 10cm high

Comes as package which also contains:—

200 sheets continuous stationery.
1 x 9½" binder.
1 x highlighter pen.
choice of rubber feet/sticky pads.

PRINTER STAND	£19.95

COMPUTER FURNITURE

Suitable for use with all leading personal computers. Features a top shelf for monitor/printer, lower shelf for books, paper and general storage; large desk top surface at keyboard height; attractive teak finish, and castors for mobility.

U.K. Manufacture. Comes in flat pack for self assembly – full instructions provided.

A further range of more sophisticated units is available – please ask for details.

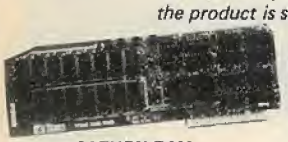
EUROPEAN DISTRIBUTOR

SATURN SYSTEMS

Have changed their name to

Titan TECHNOLOGIES, INC.

The name may have changed but the product is still the best available!



SATURN RAM

Perfect for Apple II, II+, IIe and their compatibles.
In 1981, we introduced our famous Saturn multi-bank RAM card to boost the Apple's memory by 32K. Now, we also offer 64K and 128K versions for even greater power.
Big on benefits.
Each Saturn RAM board performs all the functions of a language card. More important, its extra banks of RAM give you loads of memory space for BASIC, VisiCalc, Multiplan and much more. You can even use your RAM boards like a speedy disk drive. Save time accessing data, and save wear and tear on your floppy drives! Saturn boards are a super aid for advanced word processing, data base management, spreadsheet, and accounting applications. They're ideal with PASCAL, CP/M and BASIC too.

32K £129 128K £299

NEPTUNE

The two most popular expansion features, on a single card.
Titan's exclusive Neptune Extended 80-Column Card gives you increased video display and up to 192K of extra memory by using just the auxiliary slot of your Apple IIe. And you can select from three versions - 64K, 128K or a full 192K of RAM. Dramatic increases in speed and productivity.
Software included with Neptune lets you use the additional memory as a super-fast RAM disk-a big plus with many programs.
You also get Titan's special VIC-EXPAND/80 software to expand VisiCalc up to 220K of workspace memory and to provide many more VisiCalcenhancements.
PASCAL and CP/M PSEUDO-DISK patches and a DOS relocation program are included with each Neptune card.

64K £179 + VAT each
additional 64K (up to max 192K) – £109 + VAT

Now you can write Applesoft Programs bigger than 64K!

EMBER is written for Titan RAM Boards or Neptune extended 80 col. card. You can use as much memory as you can possibly plug into your Apple! Ember automatically puts variables and strings in expansion RAM leaving full lower 48K for program text. All bank switching is done for you. Each array can use up to 64K of RAM. Ember runs slower than Applesoft—but you can always use an Accelerator!

A **£34.95 + VAT**

Make your Apple run 3½ times faster

Imagine running VisiCalc, DB Master, Applesoft, Apple Fortran or Pascal without long delays. With the Titan Accelerator II, Your Apple II or II Plus runs these programs a true 3½ times faster. This faster computer response time means less waiting for you and an increase in your productivity.
This Titan exclusive has its own fast 6502 processor, 64K of high-speed memory, and built-in fast language card. It is transparent to your software and is hardware compatible with most standard peripherals. And you can turn it off from the keyboard to run your Apple at regular speed.

£299 + VAT

MAGICALC

Both the Apple II (minimum 48K) and the new IIe are supported, as well as expanded memory cards up to a total memory of 512K (four 128K cards). There are 254 rows and 63 columns of work space on the spreadsheet. The program works in 40 or 80 columns (most of the 80-column cards are supported). A 70-column format is provided using Hi-Res graphics. Both uppercase and lowercase entry/display are allowed. The program can be used with multiple drives including hard disks.

Q. What advanced spreadsheet features does MAGICALC have?

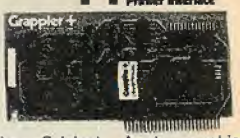
A.1. Columns may be different widths to fit your data and formats.

2. Columns may be made invisible to hide data or to operate as a third-window on the data (bring first and last quarter figures together, for example, while leaving the title and other windows unchanged).
3. Individual cells may be made invisible to hide sensitive data.
4. Cells may be protected to prevent inadvertent erasure.
5. Cells may be protected to allow only numbers or labels to aid in the setup of templates.
6. A "tab" to the next unprotected cell is provided for fast data entry into templates.
7. On-screen indication of Global Computation Order is provided, as well as Manual or Automatic Computations mode.

A **£99 + VAT**

EUROPEAN DISTRIBUTOR

Grappler+ Printer Interface



The Original Apple graphic printer interface. Since its introduction three years ago, th Grappler has been initiated b many, but never matched. Nov with Dual Hi-Res Graphics fo side by side reproductions an Mixed Mode screen dumping the Grappler+ remains the mos intelligent interface available. Ove two dozen commands give Appl users full control over any graphic or text on the Apple screen including a new 80 colum text dump.

£109 + VAT

Bufferboard For Apples and Printers

The economical way to ad printer buffering. The Buffe board easily adds memory t your current Apple interfac system, freeing your compute for additional input. Easily up gradable from 16K, the Buffe board can store up to 20 page of text. It fits neatly inside you Apple, "docking" onto you existing printer interface. N clumsy boxes or cables, n external power supplies... jus convenience and economy.

£109 + VAT

Buffered Grappler+

The most sophisticated buffere Apple printer interface availabl The New Buffered Grappler combines the industry leadin features of the Grappler + wit the time saving economies of th Bufferboard. **£179 + VAT**
With this much interface powe you'll never need anything els Over 90,000 Apple computers ar using Orange Micro product Innovation and excellence hav made us the No. 1 manufacture of intelligent printer interface The top selling Grappler + ha become an industry standar recommended by more softwar houses and Apple dealers. Recer innovations include the Grapple + for IDS colour printers an the new Orange interface, wit text screen dumps and formattin at a low price.

HELLO FAN!

The P & P fan is here!
This neat fan with power surge suppression and neon lit front facing switch will help to keep your Apple cool and avoid possible data errors by smoothing current flow and keeping the Apple's power supply and circuitry at a lower temperature. The fan is a high-quality unit at

£39.95 + VAT (Dealer and Distributor enquiries welcome.)

GLANMIRE 64K EXTENDED 80 COLUMN CARDS FOR THE APPLE IIe

– at a price you'll find hard to believe – just £89 + VAT!
This card works in the same way as Apple's own 80 column extended memory card and is covered by Pete & Pam's own 12 months warranty.

A

Sweet-P

AN INCOMPARABLE GRAPHIC PLOTTER AT ONLY £495+VAT Works on all micros with a suitable parallel interface for all your Graph Processing, Chart Processing, Engineering Graphics and Overhead Transparencies.

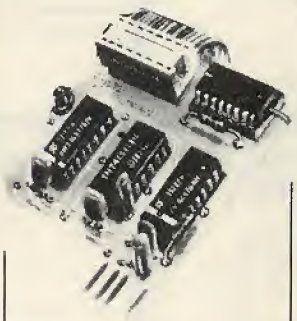
Get into Personal computing in a big way!



SNAPSHOT TWO

An accidentally erased disk can cost you weeks of time waiting for an expensive replacement. Making backup copies of all your important programs is an essential element of sensible computer use. SNAPSHOT TWO is the powerful, fast, and easy-to-use hardware/software system that gives you the power to copy your valuable software. Just boot your disk, and press the trigger. SNAPSHOT TWO removes copy protection, and copies most programs in 30 seconds, even programs that baffle other copiers. Backups are ordinary DOS 3.3 disks that will immediately boot and run on any 64K Apple (and, often, on any 48K Apple) without SNAPSHOT TWO Present.

THE INCREDIBLE JACK OF ALL TRADES

What is the incredible JACK of All Trades?
JACK is an integrated applications software package for Apple II computers. "Integrated" means that JACK can do Word Processing, Data Base Storage and Retrieval, and Calc Analysis all at the same time. Because it is integrated JACK lets you do all these things with just one simple set of commands.

Who should buy JACK?
JACK is perfect for the first-time computer buyer who works with information, be it words, numbers, or lists with words and numbers in them. You can learn JACK just once and do three times as much with your computer as with any single-function software. And JACK costs far less than buying three different programs! Experienced computer-users who need to integrate their applications should also consider JACK. If you've ever wished you could integrate a document and a calc model without scissors and glue, or 'printing to disk', JACK is for you.

What kinds of work can I do with JACK?
If your work consists of words, lists, or numbers, JACK can probably handle it. If you work with words and numbers at the same time, or lists with numbers, or even lists with words, JACK will make that work easier than any other software you can buy. Things you can't do with most software are easy with JACK: write a memo with calculations and do those calculations at the same time; or create form letters from a mailing list with a single command, or make a list of 'what-if' options and select the best one by simply telling the computer what you want.

What else makes JACK special?
Convenience. Most people use computers to prepare documents, to handle information, and to answer "what-if"-type questions. Without JACK, it takes a separate program to do each task. But most people don't work that way. We work on tasks that involve words, numbers, and record-keeping all together. And those tasks don't conveniently sort themselves into "word processing tasks", "calc tasks", and "data base tasks". By allowing you to work on one task in all three ways, at the same time, JACK offers greater convenience than single - function software packages. JACK is THE software that lets your personal computer work the way YOU do, instead of the other way around.

How long will it take me to get going with JACK?
Experienced computer-users have picked up JACK in as little as half an hour. First-timers may take a day or two. JACK comes with a step-by-step tutorial of seven lessons, so you can go at your own pace.

INCREDIBLE JACK

THE APPLE—IBM CONNECTION

This might sound like heresy, but we're sure that some of you are going to want to transfer any kind of file to and from the IBM-PC. The ability to upgrade files from the 8 bit Apple to the 16 bit IBM-PC must be of use to someone?

Can also be used to send electronic mail messages in mixed Apple / IBM-PC network. Comes with a disk for the Apple and a disk for the IBM-PC. **£139 + VAT**

NEC GREEN MONITORS

12" diagonal & 90° deflection video band width 30 Hz-20 MHz. An excellent high quality video display monitor.

Parallel £599 Serial £629

1-2-3™

Meet 1-2-3 — the remarkable new software package that puts more raw power at your fingertips than anything yet created for the IBM PC. 1-2-3 actually combines information management, spreadsheet, and graphing in one program that can perform all three functions interchangeably and instantly at the touch of a key. That's Power.

To explain : since 1-2-3's information management, spreadsheet and graphing functions reside in memory simultaneously, you can go from retrieval to spread sheet calculation to graphing instantly, just by pressing a few keys. So now you can experiment and recalculate and look at data in an endless variety of ways. As fast as your mind can think up new possibilities. There's no lag between you and the computer. And that's a new kind of power — power that's greater than the sum of its programs.

PC **£375.00 + VAT**

MULTIMATE™

Complete Function Key Orientation

MultiMate™ is the fastest, easiest to use and most powerful word processor available on microcomputers today. MultiMate™ offers a complete function key driven system for efficient document creation and modification. Most functions are performed while in the document (rather than from menus or utilities) with a minimum number of keystrokes.

Cursor Positioning Functions

MultiMate™ has the most complete set of cursor positioning capabilities available today.

Editing Functions

The standard functions such as Insert, Delete, and Move, as well as the more complex functions, are self-prompting and are performed with a minimum number of keystrokes.

Formatting Functions

Full control over tab settings, line spacing and line length are provided by MultiMate™'s format line feature. An unlimited number of format lines may be included in your document. Format line modification results in automatic text readjustment from the modified format line to the next format line or the end of the page.

Printing Functions

MultiMate™'s complete printer control capabilities allow full utilization of the features available on your printer. MultiMate™'s Header and Footer facility is unsurpassed in flexibility and ease of use. Alternate Headers and Footers are supported as well as the ability to change Header or Footer text as often as needed within a document.

Printer Control Codes provide special printing functions unique to your printer.

Document printing is performed in a "background" mode so that while a document is being printed, you may create or revise another document. Foreground printing is also provided.

The Printer Queue Control allows you to control the documents to be printed by deleting a document from the queue, placing a document on hold or releasing it from hold, moving a document to the top of the queue, and restarting a document currently printing.

Advanced Functions

MultiMate™'s Library function allows you to store an unlimited number of boilerplate phrases, paragraphs, or forms (up to one page each) on a diskette. These Library entries may be recalled for insertion into your document whenever specified.

Merge, Repaginate, Column Manipulation and the other advanced functions are also available and equally easy to use.

With the Column Manipulation function, you may Move, Copy, Delete, or Insert columns of text or numerical data in a page of your document with a few keystrokes.

Column Calculation functions provide you with the following math capabilities. Vertical and Horizontal Addition to sum columns or lines of numerical data; Subtraction, which is accomplished by designating a number as negative, and thereby is equivalent to adding a negative number. Combined, these column-oriented functions yield you considerable flexibility and versatility when creating or editing documents with numerical data.

Mylar Key Labels

See-through, color-coded, adhesive labels are provided for quick and easy identification of the function keys. Both a Help screen and a Function Location Chart are provided for use when you are working on an unmarked keyboard.

PC **£339.00 + VAT**

COPY II PC

Allows you to make back-up copies of your valuable software. **£39.95 + VAT**

SEE US AT THE WHICH COMPUTER SHOW ON STAND 2301

MULTI-TASKING PC DOS

AND MAKE ONE IBM PC WORTH NINE

TASCMASTER SOFTWARE does that by converting PC-DOS to CONCURRENT PC-DOS thus enabling you to create up to 9 tasks and run up to 9 programs simultaneously. TASCMASTER DOES THE WORK OF NINE. While you are working with a task on the screen other tasks are working for you. To give you every board you may need for your IBM PC we include with TASCMASTER SOFTWARE a powerful MULTIFUNCTION board **FREE!!**

Take you choice of:
ADDRAM ELITE FEATURES or **ADDRAM PLUS FEATURES** with RAMDISK and RAMSPOOL SOFTWARE TOO.

PC **£345.00 + VAT**

SIDEWAYS™
FOR EASY-READING HARD COPY

Now you can print all the columns of your spreadsheet, all at one time, all on one continuous page. Sideways, the ingeniously simple software program, causes your hard copy to print out — you guessed it — sideways. So your spreadsheet columns need never fall off the edge of your printer paper again.

PC **£49.49 + VAT**

INFOTORY
Stock Control System

Infotory and its special data management feature. ANY-REPORT, Provide you with a Stock Control System that is:

- *Easy to understand and use.*
- *Comprehensive enough to solve your inventory management problems.*
- *Flexible enough to offer alternatives that satisfy the needs of your particular business.*
- *State of the art - fully utilising the power and potential of your computer.*
- *Capable of handling 5000 to 65,000 stock items depending upon your floppy or hard disc drive configuration.*

PC **£350 + VAT**

AT LAST!

Someone has computerised the 'back of an envelope'

CALCMASTER *– a breakthrough in micro software technology from SAPPHIRE SYSTEMS for only* ***£49.00.***

The unique design concept of CALCMASTER means that the 'back of an envelope' system – the tried and trusted favourite that generations of businessmen have reached for to provide instant analysis and control – has now been brought well and truly into the micro age.

We've retained all the virtues of the old system – extreme low cost, ease of use, convenience and flexibility but added ***POWER, SPEED AND ACCURACY*** *to make CALCMASTER the low cost, easy to use, basic utility for business planning and control.*

By entering your calculations in English and using the power of the 1,000 cell matrix you can now use your micro to get to grips with all those 'everyday' managerial situations and events where your decisions count. Yet have enough power in reserve to handle larger functions, even including the consolidation of small to medium size models by using the unique 'Read' 'Write' and 'Nested Run' facilities.

CALCMASTER comes with a superb pocket size manual and is suitable for most 8 and 16 bit micros with CP/M, CP/M86, PC-DOS or MS-DOS operating systems and an 80 character screen width with at least 64K of memory and a single floppy disk drive.

So almost at the flick of a switch, you can now ensure that you and your company, like CALCMASTER, stay one step ahead of the competition.

Of course, when you need to move up to a more powerful system, CALCMASTER leads you naturally to the outstandingly successful ***SAPPHIRE MARS*** *– the easiest to use full structured modelling systems available. Because it's totally integrated to CALCMASTER both your experience and data are not wasted and you have the complete business planning system for* ***ALL*** *your needs.*

But first things first. To order CALCMASTER please clip the coupon and enclose your cheque or credit card details and we will send you CALCMASTER plus details of the extensive ***SAPPHIRE MASTER RANGE*** *of business software.*

To: Sapphire Systems Ltd., 1-3 Park Avenue, Ilford, Essex IG1 4LU.

Superbase 64

TRANSFORMS THE COMMODORE 64 INTO A FULL-FEATURED AND PROFESSIONAL DATABASE SYSTEM! WITH UP TO 1000 CHARACTERS PER RECORD ON UP TO 4 SCREENS... AND UP TO 128 ITEMS PER RECORD, DEFINABLE AS KEY, TEXT, NUMERIC, CONSTANT, RESULT OR DATE... IN FILES OF UP TO 16M CHARACTERS! SUPERBASE EVEN HAS SPREADSHEET AND CALCULATOR CAPABILITY, CALENDAR FUNCTIONS, EASY INPUT FROM WORDPROCESSOR/DATA FILES, BOTH MENU-DRIVEN AND PROGRAM OPTIONS, SORTING/SEARCHING, FULLY DEFINABLE OUTPUTS... SUPERBASE 64 IS ESSENTIAL IF YOU WANT THE MOST FROM YOUR 64! SUPPLIED ON CBM 1541 DISK WITH EXCELLENT TUTORIAL/REFERENCE MANUAL. EX-STOCK NOW!

● OUR PRICE ONLY ~~£99.95~~ £88!

VIZAWRITE 64

NOW AVAILABLE ON CARTRIDGE, VIZAWRITE 64 IS A HIGH-PERFORMANCE, LOW-COST WORD PROCESSOR, WITH ON-SCREEN FORMATTING, THAT TAKES FULL ADVANTAGE OF THE 64'S COLOUR, GRAPHICS AND MEMORY FEATURES... AND SUPPORTS VIRTUALLY ANY PRINTER! WITH A COMPREHENSIVE AND EASY-TO-FOLLOW USER MANUAL, VIZAWRITE OFFERS THE ULTIMATE IN PERSONAL COMPUTER WORD PROCESSING! ALSO AVAILABLE ON DISK (OUR PRICE ~~£79.95~~ £68!), OR COMBINED WITH VIZASPELL (OUR PRICE ~~£99.95~~ £85!).

● OUR PRICE ONLY ~~£89.95~~ £75!

Master 64

MASTER 64 IS A TOTALLY NEW CONCEPT... A COMPLETE PROGRAM DEVELOPMENT PACKAGE, THAT'S AVAILABLE NOW FOR THE CBM 64. MASTER HAS 85 NEW COMMANDS... AND BASIC IV TOO! PLUS PROGRAMMER'S TOOLKIT, MACHINE CODE MONITOR, BUSINESS BASIC, KEYED DISK ACCESS, SCREEN MANAGEMENT, USER-DEFINABLE INPUT ZONES, REPORT GENERATOR, 22-PLACE ARITHMETIC, DATE CONTROL, STRING FUNCTIONS, DISK DATA COMPRESSION, SCREEN PLOTTING, SCREEN DUMP, AND MORE... IN FACT EVERYTHING YOU NEED TO PROGRAM YOUR 64 TO TOP PROFESSIONAL STANDARDS! (SCREEN MANAGEMENT, TOOLKIT, HI-RES GRAPHICS AND DOS SUPPORT ARE AVAILABLE SEPARATELY ON CARTRIDGE - £49.50). MASTER IS ALSO AVAILABLE FOR CBM 700 (£339.25) AND CBM 4032/8032/8096 (~~£299.95~~ £225!).

● SPECIAL OFFER PRICE ~~£143.75~~ £115!

THESE ARE JUST SOME OF OUR FINE SOFTWARE PRODUCTS FOR COMMODORE COMPUTERS... PLEASE TELEPHONE OR WRITE FOR FREE DATA SHEETS! PRICES SHOWN INCLUDE 15% VAT AND ARE CORRECT AT TIME OF GOING TO PRESS. >NEXT MONTH

>WORD PROCESSING

Almost everyone can benefit from word processing, and almost every micro now offers a word processor, so in the March issue Special Section we offer a guide to the field. We will be examining a range of packages, from the easiest to use, like the Bank Street Writer, to the famous WordStar.

>COMPETITION

The Research Machines 480Z system is on the test bench for next month, along with its disc drives and a bundle of software including WordStar. An outfit worth £1,000 will be offered as a prize in an accompanying competition that anyone can enter.

>REVIEWS

One of the world's leading micro companies, named after a fruit, will be launching a user-friendly computer, named after a raincoat . . . but we aren't allowed to mention it. Full details in the next issue. We will also be looking at battery-powered portable computers, including hands-on experience with the new Sharp PC-5000. Software under investigation includes Oz, Expert-Ease and Atari games.

>AND MUCH MORE!

Features for March include a visit to Xerox's Parc where Smalltalk and Lisa-like environments originated. Commodore 64 owners should order their copy now: Boris Allan will be helping out with colour-graphics routines for this machine. Mike Lewis presents the second of his columns for programmers; plus there will be all the regulars, including News, Chip-Chat, and pages and pages of free software in Open File.

Make sure you don't miss the March issue of

Practical Computing

On sale at W H Smith and all leading newsagents after February 18.

WHY LOOK FOR ANYTHING ELSE WHEN YOU COULD AFFORD YOUR OWN IBM PERSONAL COMPUTER

Look.

It's easy to get to know. Even the brochures are written in plain English.

It is undemanding in terms of space. It will sit comfortably on a desk top or, if you're pushed, a filing cabinet.

And in its attitude to book-keeping, estimates, and information, it is very accommodating.

Call us today and we'll show you the IBM Personal Computer. Tel: 01-675 5325/6/7

HAND THIS CARD TO YOUR NEWSAGENT

"Honestly, we didn't pay them a penny"

Read between the lines and you'll see that Personal Computer World's high praise for the Sage accounting program is bad news for our competitors.

Until now, you might have felt justified in paying out £1,000 or more for the complicated 4–7 disk programs which they offer. You might indeed have felt that, at only £375, the Sage program couldn't possibly do the job properly.

After reading PCW's verdict there's no longer any room for doubt!

The Sage book-keeping/accounting program is truly integrated and uses one diskette.

- Sales and Purchase Ledgers,
- Nominal Ledger, ● Trial Balance,
- VAT Analysis ● Monthly and Annual Accounts ● Age Analysis ● Statements
- Audit Trail – every accounting function in one compact package.

Its efficiency is built on simplicity – and its simplicity accounts for the price.

Sage is self-installing, easy-to-learn and easy-to-use, comes with a short, clear manual and a tutorial cassette.

Sage is available on most CP/M, MS-DOS and PC-DOS computers and has so far been implemented on over forty machines including Apple, Apricot, Epson, IBM-PC, Sirius and Zenith. It's as effective in a one-man business as in a multi-million pound corporation.

We've told you all this before. But now you've seen Personal Computer World's verdict.

Its a death sentence for our competitors!

Return the coupon and we will send you more information on Sage Software systems and the name of your nearest dealer – there are over 400 of them in the UK!

NEW PRODUCT – SAGE PLUS

The same brilliant features as SAGE, plus ● Invoicing, with Stock Control. ● 9999 Ledger Accounts. ● Budget Reports. ● Credit Control Features. Still only one program disk. £695.

NEW PRODUCT – SAGE PAYROLL

● Monthly and/or weekly. ● Automatic SSP. ● 999 Employees. ● Full feature system. £195.

☐ Please send me your explanatory brochure.

☐ Please arrange for me to have a demonstration.

Innovation not imitation

● Circle No. 197

Return of the electronic brain

Chris Naylor sets his grey matter working on itself and comes up with some unexpected predictions of what can be done with a few hundred megabytes.

"OF COURSE," the man is saying, "you can do anything you want with a computer." He smiles and waves an expansive hand over his shelves of shiny machines while, before him, an uncertain customer nervously fingers a cheque book. "Anything," continues the salesman. "Absolutely anything at all. It's entirely up to you what you make it do."

And, at this point, one ceases to eavesdrop and shuffles away out of earshot so that this particular naive end-user may be fleeced in private. Too much, one thinks to oneself, to be both fleeced and to have an audience at the said fleecing.

Pausing to think for a moment about what the salesman said: is it actually incorrect. Can a computer, actually and really, do anything? To us experts, of course, the answer is No. So what, actually, would a do-anything machine look like?

Rough workings

Now the human brain is, surely the most do-anything machine in the entire known world. While admitting that there are certain difficulties in explaining exactly how it works, it is still possible to give a rough idea. The many thousands of neurons that make up our thinking engine are sufficiently similar for an idealised neuron to be taken as a pretty accurate representation of the whole lot.

Each neuron consists of a cell body out of which appear lots of little branches called dendrites and one big branch called an axon. At the end of the axon there are a lot more branches sticking out which are called terminals. These terminals come very close to the little dendrites sticking out of the cell bodies of other neurons, and sometimes come close to the actual cell bodies themselves. The junction between a terminal and a dendrite is called a synopse.

What happens is this. For some reason one of the cell bodies acquires an electrical charge. When it does so it sends a signal down the long axon to all the terminals at its end. When the signal reaches the terminals they fire the synapses and induce a corresponding signal in the nearby dendrites of other cells. As the cell potential passes a certain threshold it too sends its own signal down its own axon to other neurons. And so the process goes on. Once started it turns into an avalanche of signals until the whole brain is humming away nicely.

You can get a computer to do the same sort of thing. One bit can represent each cell body firing or not firing according to whether it is 0 or 1. A simple address takes the place of an axon with terminals out to the dendrites on other cells. Allow six terminals to each axon and give one-byte addressing for each terminal. So, connected with the bit for the cell body are six bytes for the terminal address, for other bits representing other cell bodies.

Pass it on

Now write a short piece of code to allow for the fact that the electronic neurons are not self-acting in the same way that real neurons are. All you need is a loop which scans through each of the cell-body bits, reads it, and if it is set to 1 goes on to read the terminal addresses associated with it and sets the cell bits in those addresses to 1 before passing on to read the next cell body in line.

So far the end result will be that the system jams solid with every bit set to 1 and staying there. This is because all of the electronic synapses are excitatory synapses — that is, they trigger a cell into action. Real brains also have inhibitory synapses which inhibit a cell from triggering. What your electronic analogue needs is another bit to go with each of the terminal addresses to show whether or not it is excitatory or inhibitory. Now the level of firing varies, but the whole thing should neither jam solid nor switch off altogether.

Time slice

Real axons are surrounded by something called myelin, which insulates it but also alters the speed of transmission of each nerve impulse. In a real brain, the cells can fire or stop firing as soon as they receive the appropriate signals. In the computer they have to be read and fired by a scanning process, which rather upsets the time picture by introducing an order into the events which really should not be there. Each scan should produce an instant slice of time, and if some synapses are triggered at different times due to transmission delays then you want to be able to represent this somehow or everything will get out of step. So introduce another bit to go with each cell bit, which can be either 0 or 1 depending on whether or not transmission down the axon to the terminals is to be fast or slow.

For the sake of yet more verisimiltude, add in another bit for each cell to represent the threshold level which must be provided to start each cell firing down its axon. As a final touch of accuracy the threshold bit and transmission time bit can be changed to bytes to give more variability.

Each neuron then takes up about $2n+3$ bytes, where n is the number of terminals addressed. That assumes one byte is enough to hold the terminal address — in practice two bytes per address might be better — and with, say, six terminals that gives us 21 bytes per neuron. The control program will not take up much room, so 48K of memory will give you around 2,340 neurons in the machine.

Now the human brain contains around 10^9 neurons, so machine memory size is going to be a problem. Even adding a 200K floppy gives you not much more than 10,000 neurons.

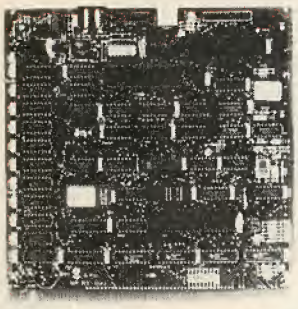
Clever snail

Still, all is not lost. A snail or a locust has between 10,000 and 100,000 in its little head and, say what you like, but the locust can fly and even the snail can get about.

So there you have the makings of an intelligent computer which can do anything that, say, a snail can do. The real problem as always, lies in the software — in particular specifying all those terminal addreses and whether they should be excitatory or inhibitory. Somehow the human brain already has it all built-in, and it can alter its own threshold values over a period so that different connections come into play at appropriate times.

If you worked out one address for each of those 10^9 neurons every five seconds and put it in the machine you'd be through the lot in less than 160 years. Or maybe you could write a program to do it all for you. It is an attractive thought certainly, and there do not seem to be any theoretical problems. Maybe if 160 programmers worked for a year without sleep . . .

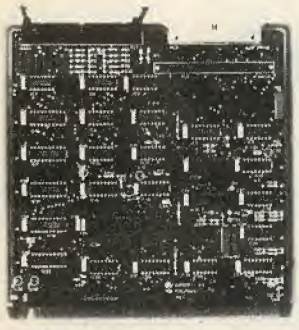
MicroValue 80-BUS MULTIBOARDS



GM813—CPU/64K RAM Board

* 4MHz Z80A C.P.U.
* 64K Dynamic RAM
* RS232 Interface
* Two 8-Bit I/O Ports
* Cassette Interface
* Extended & Page Addressing Modes
* CP/M Compatible Monitor

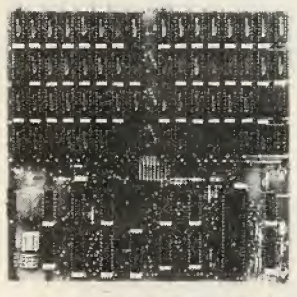
£225



GM829—Disk Controller Board

* Up To 4 Mixed 5.25 & 8" Drives
* SASI Hard Disk Interface
* Single & Double Density Operation
* Single & Double Sided Drive Support
* Supports 48 and 96 TPI Drives

£145

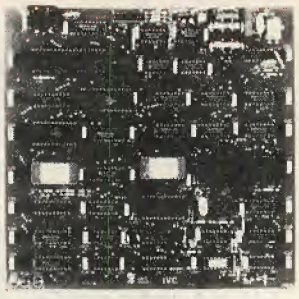


GM833—RAM-DISK Board

* Virtual Disk Operation
* 512K Dynamic RAM
* Port Mapped For Easy Interface Software
* Over 10 Times Faster Than a Floppy Disk

£450

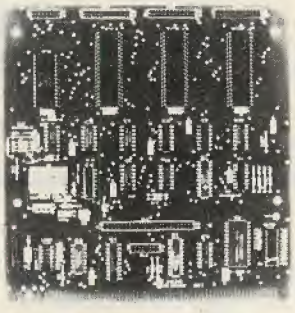
Please note: This board cannot be used as a conventional RAM board



GM812—Video Controller Board

* 80 Characters×25 Line Display Format
* On-board Z80A Microprocessor
* Buffered Keyboard Input
* Programmable Character Generator
* 160×75 Pixel Graphics
* Light Pen Input

£125



GM816—Multi I/O Board

* 6 I/O Ports
* 4 Counter/Timer Channels
* On-Board Real Time Clock
* Battery Backup
* Further Expansion Capability

£125

PLUTO—Colour Graphics Board

* On-Board 16 Bit Microprocessor
* 640×576 Bit Mapped Display
* 192K Of Dual Ported RAM
* Comprehensive On-Board Software

£499

CLIMAX—Colour Graphics Board

* 256×256 Pixel Display
* 16 Colours
* Ultra-fast Vector & Character Generation
* Light Pen Input
* UHF or RGB Outputs

UHF Version **£199**

UHF & RGB Version **£220**

GM811—CPU Board

* 4MHz Z80A CPU
* 4 'Bytewide' Memory Sockets
* 2×8-Bit Input/Output Ports
* 8 Bit Input Port
* RS232 Serial Interface
* Cassette Recorder Interface

£125

GM803—EPROM/ROM Board

* Up to 40K of Firmware
* 2708 or 2716 EPROMS
* Page Mode Operations

£65

GM802—64K RAM Board

* 64K Dynamic RAM
* 4MHz Operation
* RAM Disable Function
* Page Mode Operation

£125

MP826—Static RAM Board

* 32K Static RAM
* Battery Backup
* Page Mode Operation

£225

EV814—IEEE488 (GPIB) Controller

* Cost Effective Controller
* Comprehensive Software Supplied
* Full Implementation
* Easy To Use

£140

GM827—87 Key Keyboard

* User Definable Function Keys
* Numeric Keypad
* Cursor Control Keys

£85

GM839—Prototyping Board

* Fibreglass P.C.B.
* 80-BUS Signal Identification
* High Density IC Capability

£12.50

MULTIBOARD COMPUTERS

Gemini Microcomputers

All the boards and components in the 80-BUS range are fully compatible and offer a very flexible and cost effective solution to your computer needs. For further information about the 80-BUS range contact your nearest MICROVALUE dealer.

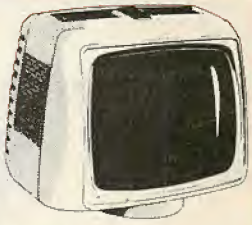
Gemini Multinet

The Gemini Multinet enables as many people as possible to have access to their own microcomputer with mass storage and printer facilities for the lowest possible cost. This is achieved by providing a central 'fileserver' fitted with a Winchester hard disk unit and printer interfaces, in conjunction with a method of interconnecting up to thirty-one workstations to the fileserver. The fileserver and each station are fitted with the Gemini GM836 network interface board. A Micropolis 800K floppy disk drive is incorporated in the fileserver providing backup for the hard disk.

GM910 Galaxy 4 Multinet 5.4 M/byte fileserver	£2600
GM912 Galaxy 4 Multinet 10.8 M/byte fileserver	£2850
GM909 Galaxy 4 Multinet workstation	£650

Both fileservers and workstations are supplied complete with VDU's; the operating software is suppliedwith the fileserver.

Phoenix P12 Monitor



A high quality 12" data display monitor, ideal for Gemini systems. The P12 is available in both green and amber phosphor versions and has a resolution of 20Mhz. **£95**

NORMAL ORDERS - We now welcome any official Government orders
We are now happy to accept any official orders with a minimum value of £30.00 from Government Departments, Ministries and Local Authorities. We do this on the understanding that invoices will be settled within thirty days or preferably less please.
Alternately, you may send your remittance with your order if you so wish.
All other non Government bodies, cheques with order please payable to DISKING. If you are a large establishment, and cannot raise cheques without an invoice please post or telephone us your order, and we will send a pro forma invoice by return, for your accounts department to pay against.
Also bear in mind, that you do have to pay VAT, which will be added to these prices.
If you are in any doubt, please see the order form on this brochure to help you with your calculations, or telephone us for assistance.

CREDIT CARD ORDERS
We welcome Access (Mastercharge), Barclaycard (VISA) & Diners Club International, & there is NO credit card surcharge. You may write your c/card No. on your order or telephone the order day or night, 365 days a year. You may speak for as long as you like, (but don't leave long gaps otherwise our machine thinks you've gone home) and don't forget to give the following details:
1. The Cardholders Name, Address and day time telephone number
2. Delivery Address if different
3. First Class, ordinary or special post
4. Your Credit Card Number
5. What you wish to Order

You may leave the rest to US!

URGENT ORDERS
If you're posting your order, omit the word FREEPOST from our address, and use our normal postcode GU30 7EI and do not forget to stamp it FIRST CLASS. If you are a Government body as defined under 'NORMAL ORDERS' and are telephoning your official order OR are an individual or company using your credit card No., please make it clear that you wish to pay for your goods to be sent to you by FIRST CLASS POST

FIRST CLASS RATES EXC VAT	MINIDISKS	8" DISKETTES

Slaves	990.00	1090.00	1190.00	1290.00

Complete with intelligent controller, host adaptor power supply unit, fan, cabling, software and User Manual.
Free delivery in the UK.

TRADE CORNER

Write or call for our 1984 Trade pack, including our FREE sample unlabelled diskette.

A Seasonal Message to all our Customers

You'll find our prices good, and our service even better. Cheaper products you may find, but anyone can advertise anything at a silly price. Just try buying it — it's always next week! Like car salesman with the new £1000.00 cars, he had plenty of orders, but he just couldn't get the stock! surprise surprise.

Our thanks this month go to Alistair who always leaves his order for 1000 diskettes until 6.15pm and then wants delivery in London next morning — A Hapy New Year to him from DISKING, and from our local taxi driver who's getting to know the route quite well. To ALL our customers both Trade AND End User, without whom we wouldn't be here:-

*** * * A HAPPY AND PROSPEROUS NEW YEAR * * ***

EuroBEEB – basically the best controller

How to make small control systems easy:-

1. Plug the EuroBEEB ROM and the EuroBEEB power lead into the BBC
2. Connect the BBC serial port the EuroBEEB serial port
3. Switch on, and type *TERM. and press return
4. You now have control of the EuroBEEB through the BBC
5. You can now write BASIC programs directly into the battery-backed memory of the EuroBEEB, and upload or down from it to the BBC disk or cassette
6. You can program an EPROM, and use it to replace the CMOS RAM on the EuroBEEB (using CU-PROM)
7. You can program a "turnkey" line in the EuroBEEB's operating system EPROM so that it runs its program as soon as it is powered up
8. You can add an enormous range of CUBE modules through a backplane, including hi-res colour video, analog, digital and serial i/o, industrial i/o, printers, liquid crystal display, etc.,
9. You can use any RS-423 terminal instead of the BBC
10. EuroBEEB, complete with sideways ROM and cables, costs only **£249. ex. VAT** (order code CUU6592)

A MULTI-USER BUSINESS SYSTEM FOR UNDER £2,000 PER USER

If 21 megabytes of fast storage with five users and two printers sounds useful and £2000 per user seems unbelievable —give us a call and ask us to prove it!

We will explain how your sales clerk, accounts clerk, secretary and you can access your business files at the same time! And there's still that other terminal for expansion!

At COMCEN we make our own computers — Ask our advice — your alternative may be learning the hard way!

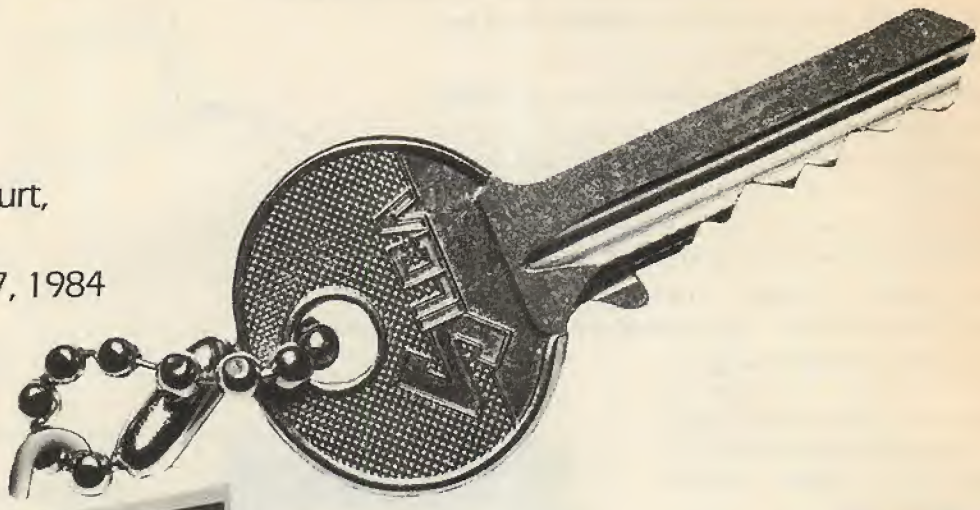
(THE KEY * TO SUCCESSFUL SOFTWARE SALES)

Earls Court,
London.
June 5-7, 1984



software '84
EXHIBITION AND CONFERENCE

Certainly the major software event of 1984 will be **Software '84,** to be held for the first time in Central London. **Software '84** will be totally dedicated to professional software sales and will be held from June 5-7, 1984 at Earls Court in the centre of London, the Nation's biggest commercial market place.

Such a show could only come from a company that understands the computer market. Reed Exhibitions, the country's largest exhibition organisers, will be staging **Software '84** with all the skill the company has already brought to the highly successful Compec shows.

Computer Weekly, Software and the National Computing Centre (NCC) will be sponsoring both the exhibition and the prestigious conference, running at the same time, guaranteeing a high level of interest in both events. The event has the full support of the Computer Services Association (CSA) and The Institute of Data Processing Management (IDPM) and are co-sponsored by 'Systems International', 'Practical Computing', 'Micro Business' and 'Computer Talk'.

Inevitably, top quality business visitors will be drawn to such a show, with DP professionals, dealers, OEM's and serious business and professional end-users all visiting the exhibition with nothing but software purchase at the forefront of their minds.

With that kind of captive audience you can't afford not to be a part of this important event. So turn the key to the booming software market and make **Software '84** the key to successful software sales. The first step is to fill in the coupon below:

Return to: The Exhibition Manager, **Software '84,** Reed Exhibitions, Surrey House, 1 Throwley Way, Sutton, Surrey SM1 4QQ

I am interested in exhibiting at **'Software '84'.** Please send me full details. ☐

I am interested in visiting **'Software '84'.** Please send me a visitor registration form. ☐

I am interested in attending **'Software '84'** Conference. Please send details. ☐

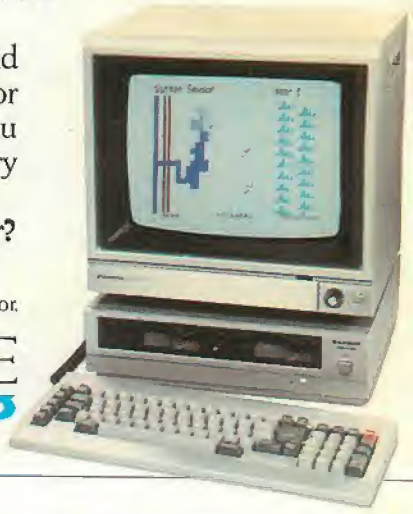
THIS YEAR WILL BE AS IMPORTANT TO THE COMPUTER INDUSTRY AS 1959 WAS TO THE MOTOR INDUSTRY.

1959 saw a revolutionary development in the evolution of the motor car that shook the industry. The launch of the Mini.

Twenty five years later, Sanyo are set to cause a similar stir in the world of computers with the launch of the first ever Small Business Micro. The Sanyo MBC 550. The first machine of its kind to offer the performance, compatibility and range of software of a true business micro for just £699.* Which is considerably less than the cheapest business micro.

So if your business requirements are too great for a personal computer and you can't justify the expense of a business micro, phone Logitek on 0257-426644, or STC on 0279-26777 or ICARUS on 01-485 5574 or clip the coupon and we'll show you the Sanyo MBC 550 or the more powerful twin drive Sanyo 555, two revolutionary new micros that mean business.

See Sanyo's new small business computer at the "Which Computer? Show," N.E.C. 17th – 20th Jan. 1984.



*Single drive excluding monitor.
